Lab: Start an HDP 2.3 Cluster

This lab explores starting an HDP cluster in your VM.

Objective:	Start an HDP cluster in your VM.
File locations:	n/a
Successful outcome:	The <u>(local or cloud-hosted) VM</u> will be running <u>HDP 2.3</u> .
Before you begin:	VMWare should be installed on your machine and the classroom VM should be imported, <u>unless you are using a cloud-hosted VM</u> .
Related lesson:	Understanding Hadoop

Perform the following steps:

Step 1: Start the VM

- 1.1. If applicable, start VMWare Player (or Fusion) on your local machine, select the course VM from the list of virtual machines, then click the Play virtual machine link.
- 1.2. You should see the desktop of your local or cloud-hosted VM:

- 1.3. Open a Terminal by double-clicking the shortcut on the desktop:

Copyright © 2015, Hortonworks, Inc. All rights reserved.

HDP Developer: Apache Pig and Hive

Step 2: Start the Cluster and verify that it is running

2.1. Navigate into the Docker sandbox instance and initiate the provisioning script:

```
root@ubuntu:~# ssh sandbox
[root@sandbox ~]# start ambari
```

2.2. From the command line, enter the following command, which displays the usage of the `hdfs dfsadmin` utility:

```
# su -l hdfs -c "hdfs dfsadmin"
```

NOTE: The “dfs” in `dfsadmin` stands for distributed filesystem, and the `dfsadmin` utility contains administrative commands for communicating with the Hadoop Distributed File System.

2.3. Notice the `dfsadmin` utility has a `-report` option, which outputs the current health of your cluster. Enter the following command to view this report:

```
# su -l hdfs -c "hdfs dfsadmin -report"
```

2.4. What is the configured capacity of your distributed filesystem? _____

Answer: Look for the value of “Configured Capacity” at the start of the output.

2.5. What is the present capacity? _____

Lester Martin Jr. 10/28/2015 4:47 PM

Deleted: Verify

Lester Martin Jr. 10/28/2015 4:47 PM

Deleted: the Cluster

Lester Martin Jr. 10/28/2015 4:47 PM

Deleted: Running

Answer: Look for the value of “Present Capacity” at the start of the output.

2.6. How much of your distributed filesystem is used right now? _____

Answer: Look for the value of “DFS Used.”

2.7. What do you think an “Under-replicated block” is? _____

Answer: Data in HDFS is chunked into blocks and copied to various nodes in the cluster. If a particular block does not have enough copies, it is referred to as “under replicated.”

2.8. How many available DataNodes does your cluster have? _____

Answer: 1

Step 3: View the Processes on the Cluster Nodes

Enter the `jps` command, which lists all Java processes running on this machine. **While your specific processes and their order they are presented in may look slightly different than the list below, you should still see the NameNode process running:**

```
# jps
3706 ResourceManager
    2988 QuorumPeerMain
3675 RunJar
4032 RunJar
3740 NodeManager
3188 Nfs3
3186 Portmap
3738 JobHistoryServer
2556 DataNode
2557 SecondaryNameNode
2560 NameNode
3712 ApplicationHistoryServer
3511 RunJar
24669 -- process information unavailable
5516 AmbariServer
31813 Jps
3029 Bootstrap
```

Step 4: View the ResourceManager UI

4.1. Open Firefox in the VM by double-clicking on the Firefox icon.

4.2. Enter the following URL:

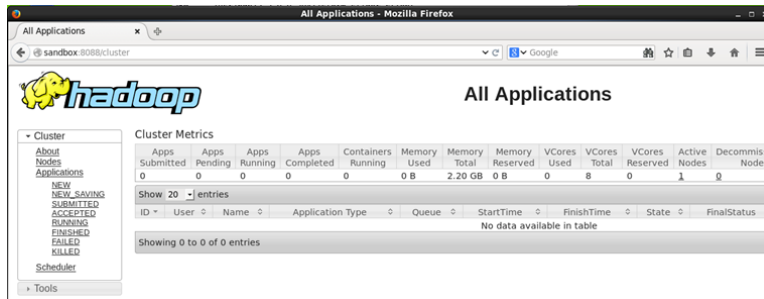

```
http://sandbox:8088/
```

4.3. Notice that the URL shows the ResourceManager Web UI:

Lester Martin Jr. 11/10/2015 1:29 PM

Deleted: You

HDP Developer: Apache Pig and Hive

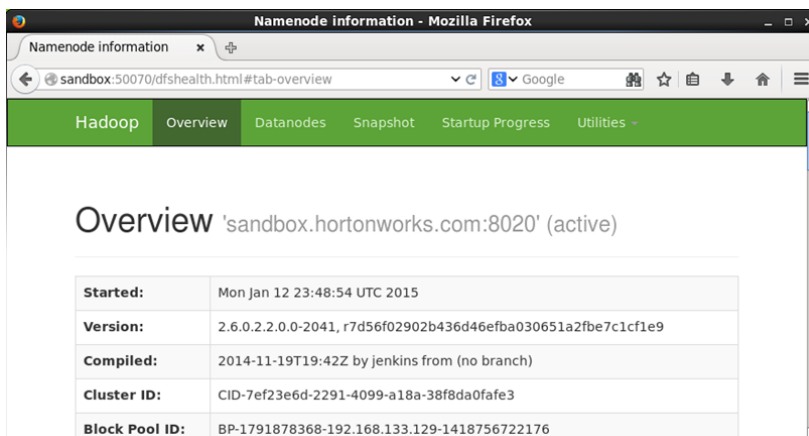

The ResourceManager UI displays information about the applications that have been executed on your Hadoop cluster.

Step 5: View the NameNode UI

5.1. Point your browser to the NameNode UI:

<http://sandbox:50070/>

Notice the NameNode UI contains a lot of information about the cluster. The Overview page shows the version of Hadoop and other details.

5.2. Scroll down to the Summary section on the Overview page and you will see a table that looks similar to the `hdfs dfsadmin -report` output:

Summary

Security is off.

Safemode is off.

492 files and directories, 327 blocks = 819 total filesystem object(s).

Heap Memory used 58.74 MB of 240 MB Heap Memory. Max Heap Memory is 240 MB.

Non Heap Memory used 53.86 MB of 132.38 MB Committed Non Heap Memory. Max Non Heap Memory is 304 MB.

Configured Capacity:	42.64 GB
DFS Used:	590.95 MB
Non DFS Used:	7.79 GB
DFS Remaining:	34.27 GB
DFS Used%:	1.35%
DFS Remaining%:	80.38%
Block Pool Used:	590.95 MB
Block Pool Used%:	1.35%
DataNodes usages% (Min/Median/Max/stdDev):	1.35% / 1.35% / 1.35% / 0.00%
Live Nodes	1 (Decommissioned: 0)
Dead Nodes	0 (Decommissioned: 0)
Decommissioning Nodes	0
Number of Under-Replicated Blocks	0
Number of Blocks Pending Deletion	0

5.3. Click on the Datanodes tab of the NameNode UI:

Node	Last contact	Admin State	Capacity	Used	Non DFS Used	Remaining	Blocks	Block pool used	Failed Volumes	Version
sandbox.hortonworks.com (192.168.98.182:50010)	0	In Service	42.64 GB	590.95 MB	7.76 GB	34.3 GB	327	590.95 MB (1.35%)	0	2.6.0.2.2.0.0-2041

Node	Last contact	Under replicated blocks	Blocks with no live replicas	Under Replicated Blocks In files under construction
------	--------------	-------------------------	------------------------------	---

You should see one DataNode in your cluster.

Step 6: View the JobHistory UI

6.1. The JobHistory UI is at:

<http://sandbox:19888/>

As it sounds, the JobHistory UI shows the jobs that have executed on your cluster. You have not submitted any jobs to your cluster yet, but this page comes in handy as you work on the labs throughout this course.

Step 7: Configure the `gedit` text editor to be launched on the "ubuntu" parent VM and to allow opening of lab files on the Docker "sandbox" VM.

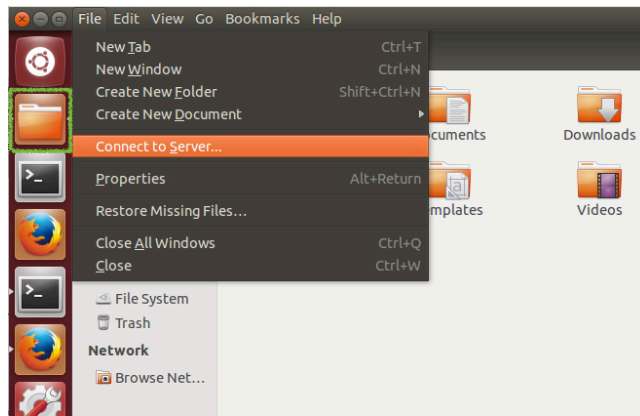

7.1. If using the hosted AWS virtual machine, click on "Places" in the upper-left corner of the VM and then "Connect to Server..." as shown below.

Lester Martin Jr. 11/10/2015 3:45 PM
Formatted: Font:(Default) Courier New, 10 pt

Lester Martin Jr. 11/10/2015 3:52 PM
Formatted: Font:Bold, Italic

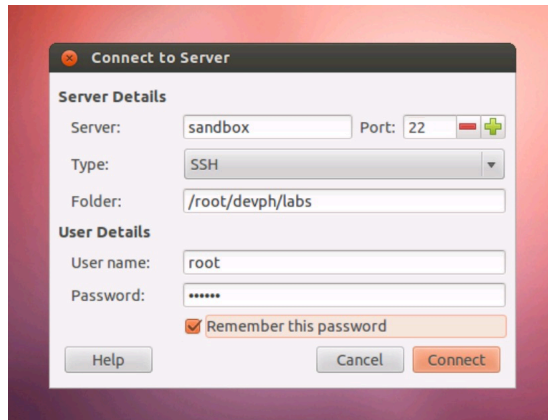

7.2. If using the downloaded VMware-based virtual machine, click on "Home Folder" icon on the left nav (highlighted within a green box in the next screenshot) and then select "File" and "Connect to Server..." as shown below.

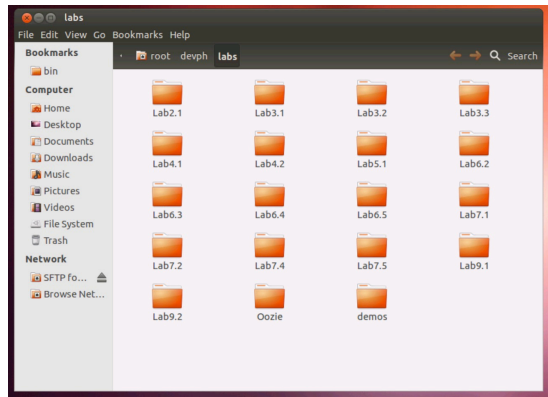

7.3. In the new dialogue box that surfaces, change the "Type" pulldown to "SSH" and update the values to look like the following (the password is "hadoop") before clicking on the "Connect" button.

HDP Developer: Apache Pig and Hive

7.4. Now you will see a UI-based view of the labs folder on the sandbox node.

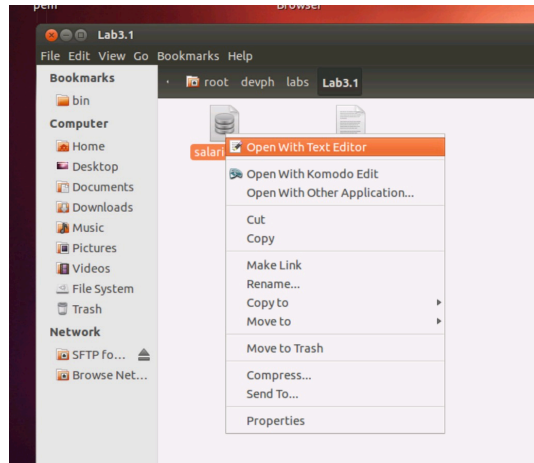

7.5. You can now open files directly by right-clicking on them and choosing the option to open with the `gedit` visual text editor or by using `gedit`'s open/new controls.

Lester Martin Jr. 11/10/2015 4:08 PM
Formatted: Font:(Default) Courier New, 10 pt

Lester Martin Jr. 11/10/2015 4:23 PM
Formatted: Font:(Default) Courier New, 10 pt

HDP Developer: Apache Pig and Hive

Result: You now have a single-node Hortonworks Data Platform 2.3 cluster running in a virtual machine. You will use this cluster to perform the labs in this course.

Demonstration: Understanding Block Storage

This lab explores how data is partitioned into blocks and stored in HDFS.

Objective:	To understand how data is partitioned into blocks and stored in HDFS.
During this Demonstration:	Watch as your instructor performs the following steps.
Related lesson:	The Hadoop Distributed File System (HDFS)

Perform the following steps:

Step 1: Put the File into HDFS

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. Change directories to `/root/devph/labs/demos/`:

```
# cd /root/devph/labs/demos/
```

1.3. Use `less` to view the contents of the `stocks.csv` file. Press `q` when you are finished to exit `less`.

```
# less stocks.csv
```

1.4. Try putting the file into HDFS with a block size of 30 bytes:

```
# hdfs dfs -D dfs.blocksize=30 -put stocks.csv
```

Notice that a size of 30 bytes is not a valid blocksize. The blocksize needs to be at least 1,048,576 according to the `dfs.namenode.fs-limits.min-block-size` property:

```
put: Specified block size is less than configured minimum value
(dfs.namenode.fs-limits.min-block-size): 30 < 1048576
```

1.5. Try the put again, but use a block size of 2,000,000:

```
# hdfs dfs -D dfs.blocksize=2000000 -put stocks.csv
```

Notice that 2,000,000 is not a valid blocksize because it is not a multiple of 512 (the checksum size).

1.6. Try the put again, but this time use 1,048,576 for the blocksize:

```
# hdfs dfs -D dfs.blocksize=1048576 -put stocks.csv
```

1.7. This time the put command should have worked. Use `ls` to verify that the file is in HDFS in the `/user/root` folder:

Deleted: hadoop

Lester Martin Jr. 10/28/2015 4:57 PM

Deleted: hadoop

Lester Martin Jr. 10/28/2015 4:58 PM

Deleted: adoop

HDP Developer: Apache Pig and Hive

```
# hdfs dfs -ls
Found 1 items
-rw-r--r-- 1 root root 3613198 stocks.csv
```

Step 2: View the Number of Blocks

2.1. Run the following command to view the number of blocks that were created for `stocks.csv`:

```
# hdfs fsck /user/root/stocks.csv
```

2.2. Notice there are four blocks. Look for the following line in the output:

```
Total blocks (validated): 4 (avg. block size 903299 B)
```

Step 3: Find the Actual Blocks

3.1. Enter the same `fsck` command as before, but add the `-files` and `-blocks` options:

```
# hdfs fsck /user/root/stocks.csv -files -blocks
```

Notice the output contains the block IDs, which are coincidentally the names of the files on the DataNodes.

3.2. Run the command again, but this time add the `-locations` flag:

```
# hdfs fsck /user/root/stocks.csv -files -blocks -locations
```

Notice in the output that the IP address of the DataNode appear next to each block.

3.3. Change directories to the following:

```
# cd /hadoop/hdfs/data/current/BP-xxx/current/finalized/
```

Replace `BP-xxx` with the actual folder name. To finish this, use the `TAB` key to complete the filename once you have typed `B`. Then finish typing the rest of the directory path.

3.4. Try and find the folder that contains the blocks you are looking for and change directories into that folder. The easiest way is to look at the timestamps and find the most recently changed folder. You can use the `stat *` command to view the contents of the directory, then use `ll` to list the contents of that directory.

```
# stat *
# cd <most recently created directory - for example, subdir0>
# ll
```

IMPORTANT: If the results of the `ll` command are additional subdirectories rather than block information (as shown in the next lab step), repeat the process above to once again find the newest directory created, change to it, and list its contents.

Lester Martin Jr. 10/28/2015 4:58 PM

Deleted: adoop

Lester Martin Jr. 11/10/2015 4:32 PM

Deleted: 3

3.5. Notice that the actual blocks appear in this folder. Look for files that are exactly 1,048,576 bytes. These are three of the blocks. Notice that the fourth block is smaller: 467,470 bytes.

```
-rw-r--r-- 1 hdfs hdfs 1048576 blk_1073742090
-rw-r--r-- 1 hdfs hdfs 8199 blk_1073742090_1266.meta
-rw-r--r-- 1 hdfs hdfs 1048576 blk_1073742091
-rw-r--r-- 1 hdfs hdfs 8199 blk_1073742091_1267.meta
-rw-r--r-- 1 hdfs hdfs 467470 blk_1073742093
-rw-r--r-- 1 hdfs hdfs 3663 blk_1073742093_1269.meta
```

3.6. You can view the contents of a block (although this is not a typical task in Hadoop). Here is the tail of the second block:

```
# tail blk_1073741905
NYSE,XKK,2007-08-20,9.51,9.64,9.30,9.51,4700,7.17
NYSE,XKK,2007-08-17,9.30,9.99,9.26,9.57,3900,7.21
NYSE,XKK,2007-08-16,9.45,10.00,8.11,9.05,23400,6.82
NYSE,XKK,2007-08-15,9.51,9.51,9.18,9.35,4900,7.04
NYSE,XKK,2007-08-14,9.52,9.52,9.51,9.51,1100,7.17
NYSE,XKK,2007-08-13,9.60,9.60,9.56,9.56,3000,7.20
NYSE,XKK,2007-08-10,9.82,9.82,9.60,9.60,2500,7.23
NYSE,XKK,2007-08-09,9.83,9.87,9.82,9.82,4500,7.40
NYSE,XKK,2007-08-08,9.45,9.90,9.45,9.66,6000,7.28
NYSE,XKK,2007-08-07,9.25,9.50,9.25,9.40
```

Notice the last record in this file is not complete and spills over to the next block, a common occurrence in HDFS.

3.7. Go back to the home directory.

```
# cd ~
```

Lab: Using HDFS Commands

This lab explores how files are added to, removed from, and how to view files in HDFS.

Objective:	To become familiar with how files are added to and removed from HDFS and how to view files in HDFS.
File locations:	/root/devph/labs/Lab2.1
Successful outcome:	You will have added and deleted several files and folders in HDFS.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	The Hadoop Distributed File System (HDFS)

Perform the following steps:

Step 1: View the `hdfs dfs` Command

- 1.1. Open a Terminal in your VM and type `"ssh sandbox"`.
- 1.2. Enter the following command to view the usage of `hdfs dfs`:

```
# hdfs dfs
```

1.3. Notice that the usage contains options for performing filesystem tasks in HDFS, like copying files from a local folder into HDFS, retrieving a file from HDFS, copying and moving files around, and making and removing directories. In this lab, you will perform these commands, and many others, to help you become comfortable with working with HDFS.

Step 2: Create a Directory in HDFS

- 2.1. Enter the following `-ls` command to view the contents of the user's root directory in HDFS, which is `/user/root`

```
# hdfs dfs -ls
```

You do not have any files in `/user/root` yet, so no output is displayed.

Run the `-ls` command again, but this time specify the root HDFS folder:

```
# hdfs dfs -ls /
```

The output should look similar to:

```
Found 10 items
drwxrwxrwx - yarn  hadoop      0 2014-12-16 19:06 /app-logs
drwxr-xr-x - hdfs  hdfs       0 2014-12-16 19:13 /apps
drwxr-xr-x - hdfs  hdfs       0 2014-12-16 19:48 /demo
```

HDP Developer: Apache Pig and Hive

```
drwxr-xr-x - hdfs hdfs 0 2014-12-16 19:07 /hdp
drwxr-xr-x - mapred hdfs 0 2014-12-16 19:06 /mapred
drwxr-xr-x - hdfs hdfs 0 2014-12-16 19:06 /mr-history
drwxr-xr-x - hdfs hdfs 0 2014-12-16 19:37 /ranger
drwxr-xr-x - hdfs hdfs 0 2014-12-16 19:08 /system
drwxrwxrwx - hdfs hdfs 0 2014-12-16 19:29 /tmp
drwxr-xr-x - hdfs hdfs 0 2015-01-12 05:34 /user
```

IMPORTANT: Notice how adding the / in the `-ls` command caused the contents of the root folder to display, but leaving off the / showed the contents of `/user/root`, which is the default prefix if you leave off the leading / on any of the hadoop commands (assuming the command is run by the “root” user).

2.2. Enter the following command to create a directory named test in HDFS:

```
# hdfs dfs -mkdir test
```

2.3. Verify that the folder was created successfully:

```
# hdfs dfs -ls
Found 1 items
drwxr-xr-x - root root 0 test
```

2.4. Create a couple of subdirectories for test:

```
# hdfs dfs -mkdir test/test1
# hdfs dfs -mkdir -p test/test2/test3
```

Notice how the `-p` command can be used to create multiple directories. The second command above will fail if you omit the `-p`.

2.5. Use the `-ls` command to view the contents of `/user/root`:

```
# hdfs dfs -ls
```

Notice you only see the test directory. To recursively view the contents of a folder, use `-ls -R`:

```
# hdfs dfs -ls -R
```

The output should look like:

```
drwxr-xr-x - root root 0 test
drwxr-xr-x - root root 0 test/test1
drwxr-xr-x - root root 0 test/test2
drwxr-xr-x - root root 0 test/test2/test3
```

Step 3: Delete a Directory

3.1. Delete the test2 folder (and recursively, its subcontents) using the `-rm -R` command:

```
# hdfs dfs -rm -R test/test2
```

3.2. Now run the `-ls -R` command:

Deleted: adoop

Lester Martin Jr. 10/28/2015 4:59 PM
Deleted: adoop

HDP Developer: Apache Pig and Hive

```
# hdfs dfs -ls -R
```

The directory structure of the output should look like:

```
.Trash
.Trash/Current
.Trash/Current/user
.Trash/Current/user/root
.Trash/Current/user/root/test
.Trash/Current/user/root/test/test2
.Trash/Current/user/root/test/test2/test3
test
test/test1
```

NOTE: Notice Hadoop created a .Trash folder for the root user and moved the deleted content there. The .Trash folder empties automatically after a configured amount of time.

Step 4: Upload a File to HDFS

4.1. Now let's put a file into the test folder. Change directories to /root/devph/labs/Lab2.1:

```
# cd /root/devph/labs/Lab2.1/
```

4.2. Notice this folder contains a file named data.txt:

```
# tail data.txt
```

4.3. Run the following `-put` command to copy data.txt into the test folder in HDFS:

```
# hdfs dfs -put data.txt test/
```

4.4. Verify that the file is in HDFS by listing the contents of test:

```
# hdfs dfs -ls test
```

The output should look like the following:

```
Found 2 items
-rw-r--r-- 1 root root 1529355 test/data.txt
drwxr-xr-x - root root 0 test/test1
```

Step 5: Copy a File in HDFS

5.1. Now copy the data.txt file in test to another folder in HDFS using the `-cp` command:

```
# hdfs dfs -cp test/data.txt test/test1/data2.txt
```

5.2. Verify that the file is in both places by using the `-ls -R` command on test. The output should look like the following:

```
# hdfs dfs -ls -R test
-rw-r--r-- 1 root root 1529355 test/data.txt
```

HDP Developer: Apache Pig and Hive

```
drwxr-xr-x  - root root          0 test/test1
-rw-r--r--  1 root root    1529355 test/test1/data2.txt
```

5.3. Now delete the data2.txt file using the `-rm` command:

```
# hdfs dfs -rm test/test1/data2.txt
```

5.4. Verify that the data2.txt file is in the `.Trash` folder.

Step 6: View the Contents of a File in HDFS

6.1. You can use the `-cat` command to view text files in HDFS. Enter the following command to view the contents of data.txt:

```
# hdfs dfs -cat test/data.txt
```

6.2. You can also use the `-tail` command to view the end of a file:

```
# hdfs dfs -tail test/data.txt
```

Notice the output this time is only the last 20 rows of data.txt.

Step 7: Getting a File from HDFS

7.1. See if you can figure out how to use the `get` command to copy test/data.txt from HDFS into your local `/tmp` folder.

Answer:

```
# hdfs dfs -get test/data.txt /tmp/
# cd /tmp
# ls
```

Step 8: The `getmerge` Command

8.1. Put the file `/root/devph/labs/demos/small_blocks.txt` into the test folder in HDFS. You should now have two files in test: data.txt and small_blocks.txt.

Answer:

```
# hdfs dfs -put /root/devph/labs/demos/small_blocks.txt test/
```

8.2. Run the following `getmerge` command:

```
# hdfs dfs -getmerge test /tmp/merged.txt
```

8.3. What did the previous command do? Did you open the file merged.txt to see what happened?

Answer: The two files that were in the test folder in HDFS were merged into a single file and stored on the local file system.

Step 9: Specify the Block Size and Replication Factor

9.1. Put `/root/devph/labs/Lab2.1/data.txt` into `/user/root` in HDFS, giving it a blocksize of 1,048,576 bytes.

HDP Developer: Apache Pig and Hive

HINT: The blocksize is defined using the `dfs.blocksize` property on the command line.

Answer:

```
# hdfs dfs -D dfs.blocksize=1048576 -put data.txt data.txt
```

9.2. Run the following `fsck` command on `data.txt`:

```
# hdfs fsck /user/root/data.txt
```

9.3. How many blocks are there for this file? _____

Answer: The file should be broken down into two blocks.

Result: You should now be comfortable with executing the various HDFS commands, including creating directories, putting files into HDFS, copying files out of HDFS, and deleting files and folders.

Lab: Importing RDBMS Data into HDFS

This lab explores importing data from a database into HDFS.

Objective:	Import data from a database into HDFS.
File locations:	/root/devph/labs/Lab3.1/
Successful outcome:	You will have imported data from MySQL into folders in HDFS.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Inputting Data into HDFS

Perform the following steps:

Step 1: Create a Table in MySQL

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. From the command prompt, change directories to `/root/devph/labs/Lab3.1/`:

```
# cd ~/devph/labs/Lab3.1/
```

1.3. View the contents of `salaries.txt`:

```
# tail salaries.txt
```

The comma-separated fields represent a gender, age, salary, and zip code.

1.4. Notice that there is a `salaries.sql` script that defines a new table in MySQL named `salaries`. For this script to work, you need to copy `salaries.txt` to the `/tmp` directory:

```
# cp salaries.txt /tmp
```

1.5. Now run the `salaries.sql` script using the following command:

```
# mysql test < salaries.sql
```

Step 2: View the Table

2.1. To verify that the table is populated in MySQL, open the `mysql` prompt:

```
# mysql
```

2.2. Switch to the test database, which is where the `salaries` table was created:

```
mysql> use test;
```

2.3. Run the `show tables` command and verify that `salaries` is defined:

```
mysql> show tables;
+-----+
| Tables_in_test |
```

Lester Martin Jr. 11/3/2015 4:14 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:14 PM

Formatted: No bullets or numbering

Lester Martin Jr. 10/19/2015 10:30 AM

Deleted: 1

```
+-----+
| salaries |
+-----+
1 row in set (0.00 sec)
```

2.4. Select 10 items from the table to verify that it is populated:

```
mysql> select * from salaries limit 10;
+-----+-----+-----+-----+-----+
| gender | age | salary | zipcode | id |
+-----+-----+-----+-----+-----+
| F      | 66 | 41000 | 95103 | 1 |
| M      | 40 | 76000 | 95102 | 2 |
| F      | 58 | 95000 | 95103 | 3 |
| F      | 68 | 60000 | 95105 | 4 |
| M      | 85 | 14000 | 95102 | 5 |
| M      | 14 | 0      | 95105 | 6 |
| M      | 52 | 2000  | 94040 | 7 |
| M      | 67 | 99000 | 94040 | 8 |
| F      | 43 | 11000 | 94041 | 9 |
| F      | 37 | 65000 | 94040 | 10 |
+-----+-----+-----+-----+-----+
```

2.5. Exit the mysql prompt:

```
mysql> exit
```

Step 3: Import the Table into HDFS

3.1. Enter the following Sqoop command (all on a single line), which imports the salaries table in the test database into HDFS:

```
# sqoop import --connect jdbc:mysql://sandbox/test?user=root --table salaries
```

3.2. A MapReduce job should start executing, and it may take a couple of minutes for the job to complete.

Step 4: Verify the Import

4.1. View the contents of your HDFS folder:

```
# hdfs dfs -ls
```

4.2. You should see a new folder named salaries. View its contents:

```
# hdfs dfs -ls salaries
Found 4 items
-rw-r--r-- 1 root hdfs 272 salaries/part-m-00000
-rw-r--r-- 1 root hdfs 241 salaries/part-m-00001
-rw-r--r-- 1 root hdfs 238 salaries/part-m-00002
-rw-r--r-- 1 root hdfs 272 salaries/part-m-00003
```

4.3. Notice there are four new files in the salaries folder named part-m-0000x. Why are there four of these files?

Lester Martin Jr. 10/28/2015 5:01 PM

Deleted: adoop

Lester Martin Jr. 10/28/2015 5:01 PM

Deleted: adoop

HDP Developer: Apache Pig and Hive

Answer: The MapReduce job that executed the Sqoop command used four mappers, so there are four output files (one from each mapper).

4.4. Use the cat command to view the contents of the files. For example:

```
# hdfs dfs -cat salaries/part-m-00000
```

Notice the contents of these files are the rows from the salaries table in MySQL. You have now successfully imported data from a MySQL database into HDFS. Notice that you imported the entire table with all of its columns. In the next step, you will import only specific columns of a table.

Step 5: Specify Columns to Import

5.1. Using the --columns argument, write a Sqoop command that imports the salary and age columns (in that order) of the salaries table into a directory in HDFS named salaries2. In addition, set the -m argument to 1 so that the result is a single file.

Solution:

The command you enter in the command line will look like this in the terminal window:

```
# sqoop import --connect jdbc:mysql://sandbox/test?user=root --table salaries --columns salary,age -m 1 --target-dir salaries2
```

To make it easier to read, below is the same command as above, however we have broken it down into smaller chunks separated by a "\ " at the end of the break point in each line. When you see this formatting in the lab, you should type it out as it appears above, and do not enter the \ characters unless specifically instructed to do so.

```
# sqoop import --connect jdbc:mysql://sandbox/test?user=root \  
--table salaries \  
--columns salary,age \  
-m 1 \  
--target-dir salaries2
```

5.2. After the import, verify you only have one part-m file in salaries2:

```
# hdfs dfs -ls salaries2  
Found 1 items  
-rw-r--r-- 1 root hdfs 482 salaries2/part-m-00000
```

5.3. Verify that the contents of part-m-00000 are only the two columns you specified:

```
# hdfs dfs -cat salaries2/part-m-00000  
The last few lines should look like the following:  
69000.0,97  
91000.0,48  
0.0,1  
48000.0,45  
3000.0,39  
14000.0,84
```

Step 6: Importing from a Query

Lester Martin Jr. 10/28/2015 5:01 PM

Deleted: adoop

Lester Martin Jr. 10/28/2015 5:01 PM

Deleted: adoop

Lester Martin Jr. 10/28/2015 5:01 PM

HDP Developer: Apache Pig and Hive

6.1. Write a Sqoop import command that imports the rows from salaries in MySQL whose salary column is greater than 90,000.00. Use gender as the `--split-by` value, specify only two mappers, and import the data into the salaries3 folder in HDFS.

TIP: The Sqoop command will look similar to the ones you have been using throughout this lab, except you will use `--query` instead of `--table`. Recall that when you use a `--query` command you must also define a `--split-by` column, or define `-m` to be 1.

Also, do not forget to add `CONDITIONS` to the `WHERE` clause of your query, as demonstrated earlier in this unit.

Solution:

In the command below, the `"\"` **at the beginning** of line 3 just in front of `CONDITIONS` **is** part of the actual command and is required for it to function properly. All other `\` symbols in the command should be ignored in the command line.

```
# sqoop import --connect jdbc:mysql://sandbox/test?user=root \  
--query "select * from salaries s where s.salary > 90000.00 and \  
\$CONDITIONS" \  
--split-by gender \  
-m 2 \  
--target-dir salaries3
```

--This is how it should appear in the command line:

```
# sqoop import --connect jdbc:mysql://sandbox/test?user=root --query "select  
* from salaries s where s.salary > 90000.00 and \$CONDITIONS" --split-by  
gender -m 2 --target-dir salaries3
```

6.2. To verify the result, view the contents of the files in salaries3. You should have only two output files.

```
# hdfs dfs -ls salaries3
```

6.3. View the contents of part-m-00000 and part-m-00001.

```
# hdfs dfs -cat salaries3/part-m-00000
```

```
# hdfs dfs -cat salaries3/part-m-00001
```

Notice that one file contains females, and the other file contains males. Why?

Answer: You used gender as the split-by column, so all records with the same gender are sent to the same mapper.

6.4. Verify that the output files contain only records whose salary is greater than 90,000.00.

Lester Martin Jr. 10/28/2015 5:03 PM

HDP Developer: Apache Pig and Hive

Result: You have imported the data from MySQL to HDFS using the entire table, specific columns, and also using the result of a query.

Lab: Exporting HDFS Data to an RDBMS

This lab explores exporting data from HDFS into a MySQL table using Sqoop.

Objective:	Export data from HDFS into a MySQL table using Sqoop.
File locations:	/root/devph/labs/Lab3.2
Successful outcome:	The data in salarydata.txt in HDFS will appear in a table in MySQL named salary2.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Inputting Data into HDFS

Perform the following steps:

Step 1: Put the Data into HDFS

1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".

1.2. Change directories to /root/devph/labs/Lab3.2:

```
# cd ~/devph/labs/Lab3.2
```

1.3. View the contents of salarydata.txt:

```
# tail salarydata.txt
M,49,29000,95103
M,44,34000,95102
M,99,25000,94041
F,93,96000,95105
F,75,9000,94040
F,14,0,95102
M,68,1000,94040
F,45,78000,94041
M,40,6000,95103
F,82,5000,95050
```

Notice the records in this file contain four values separated by commas, and the values represent a gender, age, salary, and zip code, respectively.

1.4. Create a new directory in HDFS named salarydata.

```
# hdfs dfs -mkdir salarydata
```

1.5. Put salarydata.txt into the salarydata directory in HDFS.

```
# hdfs dfs -put salarydata.txt salarydata
```

Step 2: Create a Table in the Database

Lester Martin Jr. 11/3/2015 4:14 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:14 PM

Formatted: No bullets or numbering

Lester Martin Jr. 10/19/2015 4:12 PM

Deleted: -

Lester Martin Jr. 10/19/2015 4:12 PM

Deleted: mkdir salarydata

2.1. There is a script in the Exporting HDFS Data to an RDBMS lab folder that creates a table in MySQL that matches the records in salarydata.txt. View the SQL script:

```
# more salaries2.sql
```

2.2. Run this script using the following command:

```
# mysql test < salaries2.sql
```

2.3. Verify that the table was created successfully in MySQL:

```
# mysql
mysql> use test;
mysql> describe salaries2;
+-----+-----+-----+-----+-----+-----+
| Field | Type          | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| gender | varchar(1)    | YES  |     | NULL    |       |
| age    | int(11)       | YES  |     | NULL    |       |
| salary | double        | YES  |     | NULL    |       |
| zipcode | int(11)       | YES  |     | NULL    |       |
+-----+-----+-----+-----+-----+-----+
```

2.4. Exit the mysql prompt:

```
mysql> exit
```

Step 3: Export the Data

3.1. Run a Sqoop command that exports the salarydata folder in HDFS into the salaries2 table in MySQL. At the end of the MapReduce output, you should see a log event stating that 10,000 records were exported.

```
# sqoop export \
--connect jdbc:mysql://sandbox/test?user=root \
--table salaries2 \
--export-dir salarydata \
--input-fields-terminated-by ","
```

3.2. Verify it worked by viewing the table's contents from the mysql prompt. The output should look like the following:

```
# mysql
mysql> use test;
mysql> select * from salaries2 limit 10;
+-----+-----+-----+-----+
| gender | age | salary | zipcode |
+-----+-----+-----+-----+
| M      | 57 | 39000 | 95050 |
| F      | 63 | 41000 | 95102 |
| M      | 55 | 99000 | 94040 |
| M      | 51 | 58000 | 95102 |
| M      | 75 | 43000 | 95101 |
| M      | 94 | 11000 | 95051 |
+-----+-----+-----+-----+
```

HDP Developer: Apache Pig and Hive

```
| M | 28 | 6000 | 94041 |
| M | 14 | 0 | 95102 |
| M | 3 | 0 | 95101 |
| M | 25 | 26000 | 94040 |
+-----+
```

3.3. Exit the mysql prompt.

Result: You have now used Sqoop to export data from HDFS into a database table in MySQL.

Lester Martin Jr. 10/19/2015 5:44 PM

Deleted: *Solution:* The Sqoop export command in this lab looks like: -

Lab: Importing Log Data into HDFS using Flume

This lab explores importing data from log files into HDFS using Flume.

Objective:	Import data from log file into HDFS using Flume.
File locations:	/root/devph/labs/Lab3.3
Successful outcome:	The data in webtraffic.log on sandbox will be streamed into HDFS directory /user/root/flumedata/.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Flume

Lester Martin Jr. 11/5/2015 4:25 PM

Formatted: No bullets or numbering

Perform the following steps:

Step 1: Verify Flume is installed on your cluster.

1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".

1.2. Type the following command from prompt:

```
# flume-ng
```

1.3. The command should return the following usage instructions:

```
[root@node1 ~]# flume-ng
Error: Unknown or unspecified command ''

Usage: /usr/hdp/2.2.0.0-2041/flume/bin/flume-ng.distro <command> [options]...

commands:
  help           display this help text
  agent         run a Flume agent
  avro-client    run an avro Flume client
  password       create a password file for use in flume config
  version       show Flume version info

global options:
  --conf, -c <conf>  use configs in <conf> directory
  --classpath, -C <cp>  append to the classpath
  --dryrun, -d        do not actually start Flume, just print the command
  --plugins-path <dirs> colon-separated list of plugins.d directories. See the
                        plugins.d section in the user guide for more details.
                        Default: $FLUME_HOME/plugins.d
  -Dproperty=value   sets a Java system property value
  -Xproperty=value   sets a Java -X option

agent options:
  --conf-file, -f <file> specify a config file (required)
```

Lester Martin Jr. 11/6/2015 11:32 AM

Formatted: Outline numbered + Level: 1 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: 0.31" + Indent at: 0.81"

Step 2: . View the contents of the webtraffic.log file

HDP Developer: Apache Pig and Hive

2.1. Change directories to /root/devph/labs/Labs3.3.

```
# cd /root/devph/labs/Lab3.3
```

2.2. View the contents of the webtraffic.log:

```
# less webtraffic.log
```

Press q to quit viewing the log.

2.3. A partial agent configuration has been written for you, view the file using the less command.

```
# less logagent.conf
```

2.4. From the VM desktop, start gedit.

2.5. Click Open and navigate to /root/devph/labs/Lab3.3

2.6. Modify this file replacing strings starting with "REPLACE-WITH-" (highlighted below) with their appropriate value. HINT: Search for "HDFS Sink" at <https://flume.apache.org/FlumeUserGuide.html>.

```
agent.sources = weblog
agent.channels = memoryChannel
agent.sinks = mycluster

## Sources #####
agent.sources.weblog.type = exec
agent.sources.weblog.command = tail -F REPLACE-WITH-PATH2-webtraffic.log-FILE
agent.sources.weblog.batchSize = 1
agent.sources.weblog.channels = REPLACE-WITH-CHANNEL-NAME

## Channels #####
agent.channels.memoryChannel.type = memory
agent.channels.memoryChannel.capacity = 100
agent.channels.memoryChannel.transactionCapacity = 100

## Sinks #####
agent.sinks.mycluster.type = REPLACE-WITH-CLUSTER-TYPE
agent.sinks.mycluster.hdfs.path=/user/root/flumedata
agent.sinks.mycluster.channel = REPLACE-WITH-CHANNEL-NAME
```

2.7. Click Save to save the logagent configuration.

2.8. From the terminal window, start the logagent from /root/devph/labs/Lab3.3.

```
# flume-ng agent -n agent -f logagent.conf &
```

2.9. Hit Enter to get a command prompt back.

2.10. The sink for logagent is the HDFS folder /user/root/flumedata. Verify that this folder does now exist.

```
# hdfs dfs -ls flumedata/
```

2.11. View the contents of the streamed data in HDFS in FlumeData.<#####>.

Lester Martin Jr. 11/10/2015 3:45 PM
Formatted: Font:(Default) Courier New,
10 pt

HDP Developer: Apache Pig and Hive

```
# hdfs dfs -cat flumedata/FlumeData.<#####>
```

The flumedata/FlumeData.<sequence> file should display the webtraffic as shown below:

```
[root@node1 flume]# hdfs dfs -cat flumedata/FlumeData.1445298807809
SEQ[1]prg.apache.hadoop.io.LongWritable*org.apache.hadoop.io.BytesWritable*
1874679672,http://www.facebook.com[2]
1842687,http://www.facebook.com[2]
D://www.yahoo.com[2]
6019561879,http://www.yahoo.com[root@node1 flume]#
```

Note: Notice the format difference.

Result: Successful import of data from Flume into HDFS.

Demonstration: Understanding MapReduce

This lab explores how MapReduce works.

Objective:	To understand how MapReduce works.
During this Demonstration:	Watch as your instructor performs the following steps.
Related lesson:	The MapReduce Framework

Perform the following steps:

Step 1: Put the File into HDFS

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. Change directories to the demos folder:

```
# cd ~/devph/labs/demos/
```

1.3. Use `more` to look at a file named `constitution.txt`. Press `q` to exit when finished.

```
# more constitution.txt
```

1.4. Put the file into HDFS:

```
# hdfs dfs -put constitution.txt
```

Step 2: Run the WordCount Job

2.1. The following command runs a wordcount job on the `constitution.txt` and writes the output to `wordcount_output`:

```
# yarn jar /usr/hdp/current/hadoop-mapreduce-client/hadoop-mapreduce-examples.jar wordcount constitution.txt wordcount_output
```

2.2. Notice that a MapReduce job gets submitted to the cluster. Wait for the job to complete.

Step 3: View the Results

3.1. View the contents of the `wordcount_output` folder:

```
# hdfs dfs -ls wordcount_output
```

```
Found 2 items
-rw-r--r-- 1 root root 0 wordcount_output/_SUCCESS
-rw-r--r-- 1 root root 17049 wordcount_output/part-r-00000
```

3.2. Why is there one `part-r` file in this directory? _____

Answer: The job only used one reducer.

3.3. What does the "r" in the filename stand for? _____

HDP Developer: Apache Pig and Hive

Answer: The “r” stands for “reducer.”

3.4. View the contents of `part-r-00000`:

```
# hdfs dfs -cat wordcount_output/part-r-00000
```

3.5. Why are the words sorted alphabetically? _____

Answer: The key in this MapReduce job is the word, and keys are sorted during the shuffle/sort phase.

3.6. What was the key output by the WordCount reducer? _____

Answer: The reducer’s output key was each word.

3.7. What was the value output by the WordCount reducer? _____

Answer: The value output by the reducer was the sum of the 1s, which is the number of occurrences of the word in the document.

3.8. Based on the output of the reducer, what do you think the mapper output would be as `key/value` pairs? _____

Answer: The mapper outputs each word as a key and the number 1 as each value.

Lab: Running a MapReduce Job

This lab explores how to run a Java MapReduce job.

Objective:	Run a Java MapReduce job.
File locations:	/root/devph/labs/Lab4.1
Successful outcome:	You will see the results of the Inverted Index job in the inverted/output folder in HDFS.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	The MapReduce Framework

Perform the following steps:

Step 1: Put the Data into HDFS

1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".

1.2. The MapReduce job you are going to execute is an Inverted Index application, one of the very first use cases for MapReduce. Open a command prompt and change directories to /root/labs/Lab4.1:

```
# cd ~/devph/labs/Lab4.1
```

1.3. Use more to view the contents of the file hortonworks.txt.

```
# more hortonworks.txt
```

Each line looks like:

```
http://hortonworks.com/,hadoop,webinars,articles,download,enterprise,team,rel  
iability
```

Each line of text consists of a Web page URL, followed by a comma-separated list of keywords found on that page.

1.4. Make a new folder in HDFS named inverted/input:

```
# hdfs dfs -mkdir -p inverted/input
```

1.5. Put hortonworks.txt into HDFS into the inverted/input/ folder. This file will be the input to the MapReduce job.

```
# hdfs dfs -put hortonworks.txt inverted/input/
```

Step 2: Run the Inverted Index Job

2.1. From the /root/devph/labs/Lab4.1 folder, enter the following command (all on a single line):

Lester Martin Jr. 11/3/2015 4:14 PM

Deleted: About this Lab

Lester Martin Jr. 10/19/2015 5:52 PM

Deleted: mkdir -p

HDP Developer: Apache Pig and Hive

```
# yarn jar invertedindex.jar inverted.IndexInverterJob inverted/input
inverted/output
```

2.2. Wait for the MapReduce job to execute. The final output should look like:

```
File Input Format Counters
      Bytes Read=1126
File Output Format Counters
      Bytes Written=2997
```

Step 3: View the Results

3.1. List the contents of the inverted/output folder.

```
# hdfs dfs -ls inverted/output
```

How many reducers did this job use? _____

How can you determine this from the contents of inverted/output?

Answer: The job used one reducer, which you can determine by the existence of only one part-r-n file in the output directory.

3.2. Use the cat command to view the contents of inverted/output/part-r-00000. The file should look like:

```
# hdfs dfs -cat inverted/output/part-r-00000
about http://hortonworks.com/about-us/,
apache
  http://hortonworks.com/products/hortonworksdatapatform/,http://hortonw
orks.com/about-us/,
articles http://hortonworks.com/community/,http://hortonworks.com/,
...
```

Step 4: Specify the Number of Reducers

4.1. Try running the job again, but this time specify the number of reducers to be three:

```
# yarn jar invertedindex.jar inverted.IndexInverterJob
-D mapreduce.job.reduces=3 inverted/input inverted/output
```

4.2. View the contents of inverted/output. Notice there are three part-r files:

```
# hdfs dfs -ls inverted/output
Found 3 items
1 root hdfs      1221 inverted/output/part-r-00000
1 root hdfs      977  inverted/output/part-r-00001
1 root hdfs      799  inverted/output/part-r-00002
```

4.3. View the contents of the three files. How did the MapReduce framework determine which <key,value> pair to send to which reducer?

Answer: <key,value> pairs are sent to the reducer based on the hashing of the key and using the remainder of dividing by the number of reducers.

HDP Developer: Apache Pig and Hive

Result: You have now executed a Java MapReduce job from the command line that takes an input text file and outputs the inverted indexes of the lines of text. This common task is what Web search engines like Google and Yahoo! use to determine the pages associated with search terms.

Demonstration: Understanding Pig

This lab explores Pig scripts and relations.

Objective:	To understand Pig scripts and relations.
During this Demonstration:	Watch as your instructor performs the following steps.
Related lesson:	Introduction to Pig

Perform the following steps:

Step 1: Start the Grunt Shell

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. Review the contents of the file `pigdemo.txt` located in `/root/devph/labs/demos`.

```
# more /root/devph/labs/demos/pigdemo.txt
```

1.3. Start the Grunt shell:

```
# pig
```

1.4. Notice that the output includes where the logging for your Pig session will go as well as a statement about connecting to your Hadoop filesystem:

```
[main] INFO org.apache.pig.Main - Logging error messages to:
/root/devph/labs/demos/pig_1377892197767.log
[main] INFO org.apache.pig.backend.hadoop.executionengine.HExecutionEngine
- Connecting to hadoop file system at: hdfs://sandbox.hortonworks.com:8020
```

Step 2: Make a New Directory

2.1. Notice you can run HDFS commands easily from the Grunt shell. For example, run the `ls` command:

```
grunt> ls
```

2.2. Make a new directory named `demos`:

```
grunt> mkdir demos
```

2.3. Use `copyFromLocal` to copy the `pigdemo.txt` file into the `demos` folder:

```
grunt> copyFromLocal /root/devph/labs/demos/pigdemo.txt demos/
```

2.4. Verify the file was uploaded successfully:

```
grunt> ls demos
hdfs://sandbox.hortonworks.com:8020/user/root/demos/pigdemo.txt<r 1> 89
```

2.5. Change the present working directory to `demos`:

Lester Martin Jr. 11/3/2015 4:15 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:15 PM

Formatted: No bullets or numbering

Lester Martin Jr. 11/10/2015 1:34 PM

Deleted: 3

```
grunt> cd demos
grunt> pwd
hdfs://sandbox.hortonworks.com:8020/user/root/demos
```

2.6. View the contents using the cat command:

```
grunt> cat pigdemo.txt
SD      Rich
NV      Barry
CO      George
CA      Ulf
IL      Danielle
OH      Tom
CA      manish
CA      Brian
CO      Mark
```

Step 3: Define a Relation

3.1. Define the employees relation, using a schema:

```
grunt> employees = LOAD 'pigdemo.txt' AS (state, name);
```

3.2. Demonstrate the describe command, which describes what a relation looks like:

```
grunt> describe employees;
employees: {state: bytearray,name: bytearray}
```

NOTE: Fields have a data type, and we will discuss data types later in this unit. Notice that the default data type of a field (if you do not specify one) is bytearray.

3.3. Let's view the records in the employees relation:

```
grunt> DUMP employees;
```

Notice this requires a MapReduce job to execute, and the result is a collection of tuples:

```
(SD,Rich)
(NV,Barry)
(CO,George)
(CA,Ulf)
(IL,Danielle)
(OH,Tom)
(CA,manish)
(CA,Brian)
(CO,Mark)
```

Step 4: Filter the Relation by a Field

4.1. Let's filter the employees whose state field equals CA:

```
grunt> ca_only = FILTER employees BY (state=='CA');
grunt> DUMP ca_only;
```

4.2. The output is still tuples, but only the records that match the filter appear:

```
(CA,Ulf)
(CA,manish)
(CA,Brian)
```

Step 5: Create a Group

5.1. Define a relation that groups the employees by the state field:

```
grunt> emp_group = GROUP employees BY state;
```

5.2. Bags represent groups in Pig. A bag is an unordered collection of tuples:

```
grunt> describe emp_group;
emp_group: {group: bytearray,employees: {(state: bytearray,name: bytearray)}}
```

5.3. All records with the same state will be grouped together, as shown by the output of the `emp_group` relation:

```
grunt> DUMP emp_group;
```

The output is:

```
(CA, {(CA,Ulf), (CA,manish), (CA,Brian)})
(CO, {(CO,George), (CO,Mark)})
(IL, {(IL,Danielle)})
(NV, {(NV,Barry)})
(OH, {(OH,Tom)})
(SD, {(SD,Rich)})
```

NOTE: Tuples are displayed in parentheses. Curly braces represent bags.

Step 6: The STORE Command

6.1. The `DUMP` command dumps the contents of a relation to the console. The `STORE` command sends the output to a folder in HDFS. For example:

```
grunt> STORE emp_group INTO 'emp_group';
```

Notice at the end of the MapReduce job that no records are output to the console.

6.2. Verify that a new folder is created:

```
grunt> ls
hdfs://sandbox.hortonworks.com:8020/user/root/demos/emp_group <dir>
hdfs://sandbox.hortonworks.com:8020/user/root/demos/pigdemo.txt<r 1> 89
```

6.3. View the contents of the output file:

```
grunt> cat emp_group/part-r-00000
CA      { (CA,Ulf) , (CA,manish) , (CA,Brian) }
CO      { (CO,George) , (CO,Mark) }
IL      { (IL,Danielle) }
NV      { (NV,Barry) }
OH      { (OH,Tom) }
SD      { (SD,Rich) }
```

Notice that the fields of the records (which in this case is the state field followed by a bag) are separated by a tab character, which is the default delimiter in Pig. Use the PigStorage object to specify a different delimiter:

```
grunt> STORE emp_group INTO 'emp_group_csv' USING PigStorage(',');
```

To view the results:

```
grunt > ls
```

```
grunt > cat emp_group_csv/part-r-00000
```

Step 7: Show All Aliases

7.1. The aliases command shows a list of currently defined aliases:

```
grunt> aliases;
aliases: [ca_only, emp_group, employees]
```

There will be a couple of additional numeric aliases created by the system for internal use. Please ignore them.

Step 8: Monitor the Pig Jobs

- 8.1. Point your browser to the JobHistory UI at <http://sandbox:19888/>.
- 8.2. View the list of jobs, which should contain the MapReduce jobs that were executed from your Pig Latin code in the Grunt shell.
- 8.3. Notice you can view the log files of the ApplicationMaster and also each map and reduce task.

NOTE: Three commands trigger a logical plan to be converted to a physical plan and execute as a MapReduce job: `STORE`, `DUMP`, and `ILLUSTRATE`.

Lab: Getting Started with Pig

This lab explores using Pig to navigate through HDFS and explore a dataset.

Objective:	Use Pig to navigate through HDFS and explore a dataset.
File locations:	/root/devph/labs/Lab5.1
Successful outcome:	You will have a couple of Pig programs that load the White House visitors' data, with and without a schema, and store the output of a relation into a folder in HDFS.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Introduction to Pig

Perform the following steps:

Step 1: View the Raw Data

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. Change directories to the `/root/devph/labs/Lab5.1` folder:

```
# cd ~/devph/labs/Lab5.1
```

1.3. Unzip the archive in the `/root/devph/labs/Lab5.1` folder, which contains a file named `whitehouse_visits.txt` that is quite large:

```
# unzip whitehouse_visits.zip
```

1.4. View the contents of this file:

```
# tail whitehouse_visits.txt
```

This publicly available data contains records of visitors to the White House in Washington, D.C.

Step 2: Load the Data into HDFS

2.1. Start the Grunt shell:

```
# pig
```

2.2. From the Grunt shell, make a new directory in HDFS named `whitehouse`:

```
grunt> mkdir whitehouse
```

2.3. Use the `copyFromLocal` command in the Grunt shell to copy the `whitehouse_visits.txt` file to the `whitehouse` folder in HDFS, renaming the file `visits.txt`. (Be sure to enter this command on a single line):

Lester Martin Jr. 11/3/2015 4:15 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:15 PM

Formatted: No bullets or numbering

Lester Martin Jr. 10/19/2015 6:08 PM

Deleted: 2

```
state:chararray,  
arrival:chararray  
);
```

4.2. Use the DESCRIBE command to view the schema:

```
grunt> describe B;  
B: {lname: chararray, fname: chararray, mname: chararray, id: chararray, status:  
chararray, state: chararray, arrival: chararray}
```

Step 5: The STORE Command

5.1. Enter the following STORE command, which stores the B relation into a folder named `whouse_tab` and separates the fields of each record with tabs:

```
grunt> store B into 'whouse_tab' using PigStorage('\t');
```

5.2. Verify that the `whouse_tab` folder was created:

```
grunt> ls whouse_tab
```

You should see two map output files.

5.3. View one of the output files to verify they contain the B relation in a tab-delimited format:

```
grunt> fs -tail whouse_tab/part-m-00000
```

5.4. Each record should contain seven fields. What happened to the rest of the fields from the raw data that was loaded from `whitehouse/visits.txt`?

Answer: They were simply ignored when each record was read in from HDFS.

Step 6: Use a Different Storer

6.1. In the previous step, you stored a relation using PigStorage with a tab delimiter. Enter the following command, which stores the same relation but in a JSON format:

```
grunt> store B into 'whouse_json' using JsonStorage();
```

6.2. Verify that the `whouse_json` folder was created:

```
grunt> ls whouse_json
```

6.3. View one of the output files:

```
grunt> fs -tail whouse_json/part-m-00000
```

Notice that the schema you defined for the B relation was used to create the format of each JSON entry:

```
{"lname": "MATTHEWMAN", "fname": "ROBIN", "mname": "H", "id": "U81961", "status": "735  
74", "state": "VA", "arrival": "2/10/2011 11:14"}  
{"lname": "MCALPINEDILEM", "fname": "JENNIFER", "mname": "J", "id": "U81961", "status  
": "78586", "state": "VA", "arrival": "2/10/2011 10:49"}
```

Result: You have now seen how to execute some basic Pig commands, load data into a relation, and store a relation into a folder in HDFS using different formats.

Lab: Exploring Data with Pig

This lab explores using Pig to navigate through HDFS and explore a dataset.

Objective:	Use Pig to navigate through HDFS and explore a dataset.
File locations:	whitehouse/visits.txt in HDFS
Successful outcome:	You will have written several Pig scripts that analyze and query the White House visitors' data, including a list of people who visited the President.
Before you begin:	At a minimum, complete steps 1 and 2 of the Getting Started with Pig lab.
Related lesson:	Introduction to Pig

Perform the following steps:

Step 1: Load the White House Visitor Data

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. You will use the TextLoader to load the visits.txt file. From the Pig Grunt shell, define the following `LOAD` relation:

```
# pig
grunt> A = LOAD '/user/root/whitehouse/' USING TextLoader();
```

Step 2: Count the Number of Lines

2.1. Define a new relation named `B` that is a group of all the records in `A`:

```
grunt> B = GROUP A ALL;
```

2.2. Use `DESCRIBE` to view the schema of `B`.

```
grunt> DESCRIBE B;
```

What is the datatype of the group field? _____

Where did this datatype come from?

Answer: The group field is a chararray because it is just the string "all" and is a result of performing a `GROUP ALL`.

2.3. Why does the `A` field of `B` contain no schema? _____

Lester Martin Jr. 11/3/2015 4:15 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:15 PM

Formatted: No bullets or numbering

Answer: The `A` field of `B` contains no schema because the `A` relation has no schema.

2.4. How many groups are in the relation `B`? _____

Answer: The `B` relation can only contain one group because it is a grouping of every single record. Note that the `A` field is a bag, and `A` will contain any number of tuples.

2.5. The `A` field of the `B` tuple is a bag of all of the records in `visits.txt`. Use the `COUNT` function on this bag to determine how many lines of text are in `visits.txt`:

```
grunt> A_count = FOREACH B GENERATE 'rowcount', COUNT(A);
```

NOTE: The 'rowcount' string in the `FOREACH` statement is simply to demonstrate that you can have constant values in a `GENERATE` clause. It is certainly not necessary; it just makes the output nicer to read.

2.6. Use `DUMP` on `A_count` to view the result. The output should look like:

```
grunt> DUMP A_count;
(rowcount,447598)
```

We can now conclude that there are 447,598 rows of text in `visits.txt`.

Step 3: Analyze the Data's Contents

3.1. We now know how many records are in the data, but we still do not have a clear picture of what the records look like. Let's start by looking at the fields of each record. Load the data using `PigStorage(',')` instead of `TextLoader()`:

```
grunt> visits = LOAD '/user/root/whitehouse/' USING PigStorage(',');
```

This will split up the fields by comma.

3.2. Use a `FOREACH...GENERATE` command to define a relation that is a projection of the first 10 fields of the `visits` relation.

```
grunt> firstten = FOREACH visits GENERATE $0..$9;
```

3.3. Use `LIMIT` to display only 50 records then `DUMP` the result. The output should be 50 tuples that represent the first 10 fields of `visits`:

```
grunt> firstten_limit = LIMIT firstten 50;
grunt> DUMP firstten_limit;
(PARK,ANNE,C,U51510,0,VA,10/24/2010 14:53,B0402,,)
(PARK,RYAN,C,U51510,0,VA,10/24/2010 14:53,B0402,,)
(PARK,MAGGIE,E,U51510,0,VA,10/24/2010 14:53,B0402,,)
(PARK,SIDNEY,R,U51510,0,VA,10/24/2010 14:53,B0402,,)
(RYAN,MARGUERITE,,U82926,0,VA,2/13/2011 17:14,B0402,,)
```

```
(WILE,DAVID,J,U44328,,VA,,,,)
(YANG,EILENE,D,U82921,,VA,,,,)
(ADAMS,SCHUYLER,N,U51772,,VA,,,,)
(ADAMS,CHRISTINE,M,U51772,,VA,,,,)
(BERRY,STACEY,,U49494,79029,VA,10/15/2010 12:24,D0101,10/15/2010 14:06,D1S)
```

NOTE: Because `LIMIT` uses an arbitrary sample of the data, your output will be different names but the format should look similar.

Notice from the output that the first three fields are the person's name. The next seven fields are a unique ID, badge number, access type, time of arrival, post of arrival, time of departure, and post of departure.

Step 4: Locate the POTUS (President of the United States of America)

4.1. There are 26 fields in each record, and one of them represents the visatee (the person being visited in the White House). Your goal now is to locate this column and determine who has visited the President of the United States. Define a relation that is a projection of the last seven fields (\$19 to \$25) of visits. Use `LIMIT` to only output 500 records. The output should look like:

```
grunt> lastfields = FOREACH visits GENERATE $19..$25;
grunt> lastfields_limit = LIMIT lastfields 500;
grunt> DUMP lastfields_limit;

(OFFICE,VISITORS,WH,RESIDENCE,OFFICE,VISITORS,HOLIDAY OPEN HOUSE/)
(OFFICE,VISITORS,WH,RESIDENCE,OFFICE,VISITORS,HOLIDAY OPEN HOUSES/)
(OFFICE,VISITORS,WH,RESIDENCE,OFFICE,VISITORS,HOLIDAY OPEN HOUSE/)
(CARNEY,FRANCIS,WH,WW,ALAM,SYED,WW TOUR)
(CARNEY,FRANCIS,WH,WW,ALAM,SYED,WW TOUR)
(CARNEY,FRANCIS,WH,WW,ALAM,SYED,WW TOUR)
(CHANDLER,DANIEL,NEOB,6104,AGCAOILI,KARL,)
```

It is not necessarily obvious from the output, but field \$19 in the visits relation represents the visatee. Even though you selected 500 records in the previous step, you may or may not see POTUS in the output above. (The White House has thousands of visitors each day, but only a few meet the President.)

4.2. Use `FILTER` to define a relation that only contains records of visits where field \$19 matches POTUS. Limit the output to 500 records. The output should include only visitors who met with the President. For example:

```
grunt> potus = FILTER visits BY $19 MATCHES 'POTUS';
grunt> potus_limit = LIMIT potus 500;
grunt> DUMP potus_limit;
```

```
(ARGOW,KEITH,A,U83268,,VA,,,,,2/14/2011 18:42,2/16/2011 16:00,2/16/2011
23:59,,154,LC,WIN,2/14/2011 18:42,LC,POTUS,,WH,EAST
ROOM,THOMPSON,MARGRETTE,,AMERICA'S GREAT OUTDOORS ROLLOUT EVENT
,5/27/2011,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,
,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,
,,,,,,,,)
(AYERS,JOHNATHAN,T,U84307,,VA,,,,,2/18/2011 19:11,2/25/2011 17:00,2/25/2011
23:59,,619,SL,WIN,2/18/2011 19:11,SL,POTUS,,WH,STATE
FLOO,GALLAGHER,CLARE,,RECEPTION
,5/27/2011,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,
,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,
,,,,,,,,)
```

Step 5: Count the POTUS Visitors

5.1. Let's discover how many people have visited the President. To do this, we need to count the number of records in visits where field \$19 matches POTUS. See if you can write a Pig script to accomplish this. Use the potus relation from the previous step as a starting point. You will need to use GROUP ALL and then a FOREACH projection that uses the COUNT function.

If successful, you should get 21,819 as the number of visitors to the White House who visited the President.

Solution:

```
grunt> potus = FILTER visits BY $19 MATCHES 'POTUS';
grunt> potus_group = GROUP potus ALL;
grunt> potus_count = FOREACH potus_group GENERATE COUNT(potus);
grunt> DUMP potus_count;
```

Step 6: Finding People Who Visited the President

6.1. So far you have used DUMP to view the results of your Pig scripts. In this step, you will save the output to a file using the STORE command.

6.2. Now FILTER the relation by visitors who met with the President:

```
grunt> potus = FILTER visits BY $19 MATCHES 'POTUS';
```

6.3. Define a projection of the potus relationship that contains the name and time of arrival of the visitor:

```
grunt> potus_details = FOREACH potus GENERATE
(chararray) $0 AS lname:chararray,
(chararray) $1 AS fname:chararray,
(chararray) $6 AS arrival_time:chararray,
(chararray) $19 AS visitee:chararray;
```

6.4. Order the potus_details projection by last name:

```
grunt> potus_details_ordered = ORDER potus_details BY lname ASC;
```

6.5. Store the records of `potus_details_ordered` into a folder named `potus` and using a comma delimiter:

```
grunt> STORE potus_details_ordered INTO 'potus' USING PigStorage(',');
```

6.6. View the contents of the `potus` folder:

```
grunt> ls potus
hdfs://sandbox.hortonworks.com:8020/user/root/potus/_SUCCESS<r 1> 0
hdfs://sandbox.hortonworks.com:8020/user/root/potus/part-r-00000<r 1>
501378
```

6.7. Notice that there is a single output file, so the Pig job was executed with one reducer. View the contents of the output file using `cat`:

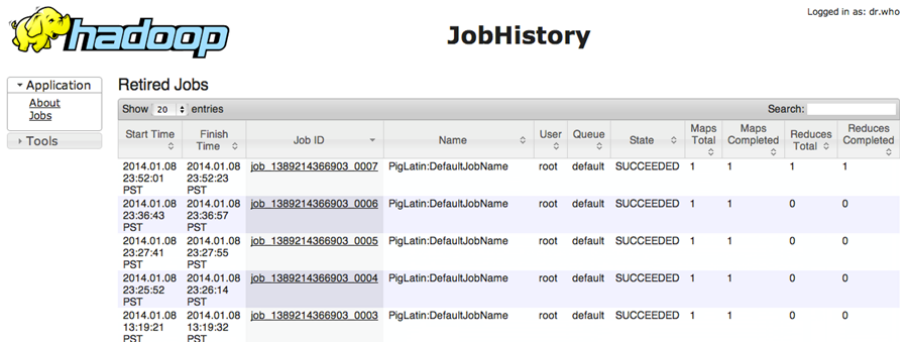

```
grunt> cat potus/part-r-00000
```

The output should be in a comma-delimited format and should contain the last name, first name, time of arrival (if available), and the string `POTUS`:

```
CLINTON,WILLIAM,,POTUS
CLINTON,HILLARY,,POTUS
CLINTON,HILLARY,,POTUS
CLINTON,HILLARY,,POTUS
CLONAN,JEANETTE,,POTUS
CLOOBECK,STEPHEN,,POTUS
CLOOBECK,CHANTAL,,POTUS
CLOOBECK,STEPHEN,,POTUS
CLOONEY,GEORGE,10/12/2010 14:47,POTUS
```

Step 7: View the Pig Log Files

7.1. Each time you executed a `DUMP` or `STORE` command, a MapReduce job is executed on your cluster. You can view the log files of these jobs in the JobHistory UI. Point your browser to `http://sandbox:19888/`:

The screenshot shows the Hadoop JobHistory UI. At the top left is the Hadoop logo. The page title is "JobHistory" and it says "Logged in as: dr.who". On the left side, there are navigation links: "Application", "About Jobs", and "Tools". The main content area is titled "Retired Jobs" and contains a table with columns: Start Time, Finish Time, Job ID, Name, User, Queue, State, Maps Total, Maps Completed, Reduces Total, and Reduces Completed. The table lists five jobs, all of which are in the "SUCCEEDED" state.

Start Time	Finish Time	Job ID	Name	User	Queue	State	Maps Total	Maps Completed	Reduces Total	Reduces Completed
2014.01.08 23:52:01 PST	2014.01.08 23:52:23 PST	job_1389214366903_0007	PigLatin:DefaultJobName	root	default	SUCCEEDED	1	1	1	1
2014.01.08 23:36:43 PST	2014.01.08 23:36:57 PST	job_1389214366903_0006	PigLatin:DefaultJobName	root	default	SUCCEEDED	1	1	0	0
2014.01.08 23:27:41 PST	2014.01.08 23:27:55 PST	job_1389214366903_0005	PigLatin:DefaultJobName	root	default	SUCCEEDED	1	1	0	0
2014.01.08 23:25:52 PST	2014.01.08 23:26:14 PST	job_1389214366903_0004	PigLatin:DefaultJobName	root	default	SUCCEEDED	1	1	0	0
2014.01.08 13:19:21 PST	2014.01.08 13:19:32 PST	job_1389214366903_0003	PigLatin:DefaultJobName	root	default	SUCCEEDED	1	1	0	0

7.2. Click on the job's ID to view the details of the job and its log files.

HDP Developer: Apache Pig and Hive

Result: You have written several Pig scripts to analyze and query the data in the White House visitors' log. You should now be comfortable with writing Pig scripts with the Grunt shell and using common Pig commands like `LOAD`, `GROUP`, `FOREACH`, `FILTER`, `LIMIT`, `DUMP`, and `STORE`.

Lab: Splitting a Dataset

This lab explores splitting a dataset, using White House visitor data, and looking for members of Congress.

Objective:	Research the White House visitor data and look for members of Congress.
File locations:	n/a
Successful outcome:	Two folders in HDFS, congress and not_congress, containing a split of the White House visitor data.
Before you begin:	You should have the White House visitor data in HDFS in /user/root/whitehouse/visits.txt.
Related lesson:	Advanced Pig Programming

Perform the following steps:

Step 1: Explore the Comments Field

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. In this step, you will explore the comments field of the White House visitor data. From the Pig Grunt shell, start by loading visits.txt:

```
# pig
grunt> cd whitehouse
grunt> visits = LOAD 'visits.txt' USING PigStorage(',');
```

1.3. Field \$25 is the comments. Filter out all records where field \$25 is null:

```
grunt> not_null_25 = FILTER visits BY ($25 IS NOT NULL);
```

1.4. Now define a new relation that is a projection of only column \$25:

```
grunt> comments = FOREACH not_null_25 GENERATE $25 AS comment;
```

1.5. View the schema of comments and make sure you understand how this relation ended up as a tuple with one field:

```
grunt> describe comments;
comments: {comment: bytearray}
```

Step 2: Test the Relation

Lester Martin Jr. 11/3/2015 4:15 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:15 PM

Formatted: No bullets or numbering

2.1. A common Pig task is to test a relation to make sure it is consistent with what you are intending it to be. But using `DUMP` on a big data relation might take too long or not be practical, so define a `SAMPLE` of comments:

```
grunt> comments_sample = SAMPLE comments 0.001;
```

2.2. Now `DUMP` the `comments_sample` relation. The output should be non-null comments about visitors to the White House, similar to:

```
grunt> DUMP comments_sample;
```

```
(ATTENDEES VISITING FOR A MEETING)
(FORUM ON IT MANAGEMENT REFORM/)
(FORUM ON IT MANAGEMENT REFORM/)
(HEALTH REFORM MEETING)
(DRIVER TO REMAIN WITH VEHICLE)
```

Step 3: Count the Number of Comments

3.1. The `comments` relation represents all non-null comments from `visits.txt`. Write Pig statements that output the number of records in the `comments` relation. The correct result is 222,839 records.

Solution:

```
comments_all = GROUP comments ALL;
comments_count = FOREACH comments_all GENERATE
    COUNT(comments);
DUMP comments_count;
```

Step 4: Split the Dataset

NOTE: Our end goal is find visitors to the White House who are also members of Congress. We could run our MapReduce job on the entire `visits.txt` dataset, but it is common in Hadoop to split data into smaller input files for specific tasks, which can greatly improve the performance of your MapReduce applications. In this step, you will split `visits.txt` into two separate datasets.

4.1. In this step, you will split `visits.txt` into two datasets: those that contain “`CONGRESS`” in the `comments` field, and those that do not.

4.2. Use the `SPLIT` command to split the `visits` relation into two new relations named `congress` and `not_congress`:

```
grunt> SPLIT visits INTO congress IF($25 MATCHES
' .* CONGRESS .*'), not_congress IF (NOT($25 MATCHES
' .* CONGRESS .*'));
```

4.3. Store the `congress` relation into a folder named ‘`congress`’.

```
grunt> STORE congress INTO 'congress';
```

4.4. Similarly, `STORE` the `not_congress` relation in a folder named ‘`not_congress`’.

HDP Developer: Apache Pig and Hive

```
grunt> STORE not_congress INTO 'not_congress';
```

4.5. View the output folders using `ls`. The file sizes should be equivalent to the following:

```
grunt> ls congress
hdfs://sandbox.hortonworks.com:8020/user/root/whitehouse/congress/_SUCCESS<r
1> 0
hdfs://sandbox.hortonworks.com:8020/user/root/whitehouse/congress/part-m-
00000<r 1> 45618
hdfs://sandbox.hortonworks.com:8020/user/root/whitehouse/congress/part-m-
00001<r 1> 0
grunt> ls not_congress
hdfs://sandbox.hortonworks.com:8020/user/root/whitehouse/not_congress/_SUCCE
S<r 1> 0
hdfs://sandbox.hortonworks.com:8020/user/root/whitehouse/not_congress/part-m-
00000<r 1> 90741587
hdfs://sandbox.hortonworks.com:8020/user/root/whitehouse/not_congress/part-m-
00001<r 1> 272381
```

4.6. View one of the output files in `congress` and make sure the string “CONGRESS” appears in the comment field:

```
grunt> cat congress/part-m-00000
```

Step 5: Count the Results

5.1. Write Pig statements that output the number of records in the `congress` relation. This will tell us how many visitors to the White House have “CONGRESS” in the comments of their visit log. The correct result is 102.

NOTE: You now have two datasets: one in ‘`congress`,’ with 102 records, and the remaining records in the ‘`not_congress`’ folder. These records are still in their original, raw format.

Solution:

```
grunt> congress_grp = GROUP congress ALL;
grunt> congress_count = FOREACH congress_grp GENERATE COUNT(congress);
grunt> DUMP congress_count;
```

Result: You have just split ‘`visits.txt`’ into two datasets, and you have also discovered that 102 visitors to the White House had the word “CONGRESS” in their comments field. We will further explore these visitors in the next lab as we perform a join with a dataset containing the names of members of Congress.

Lab: Joining Datasets

This lab explores joining two datasets in Pig.

Objective:	Join two datasets in Pig.
File locations:	/root/devph/labs/Lab6.2
Successful outcome:	A file of members of Congress who have visited the White House.
Before you begin:	If you are in the Grunt shell, exit it using the <code>quit</code> command. In this lab, you will write a Pig script in a text file.
Related lesson:	Advanced Pig Programming

Perform the following steps:

Step 1: Upload the Congress Data

1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".

1.2. Put the file /root/devph/labs/Lab6.2/congress.txt into the whitehouse directory in HDFS.

```
# hdfs dfs -put /root/devph/labs/Lab6.2/congress.txt whitehouse
```

1.3. Use the `hdfs dfs -ls` command to verify that the congress.txt file is in whitehouse, and use `hdfs dfs -cat` to view its contents. The file contains the names of and other information about the members of the U.S. Congress.

```
# hdfs dfs -ls whitehouse
```

```
# hdfs dfs -cat whitehouse/congress.txt
```

Step 2: Create a Pig Script File

2.1. In this lab, you will not use the Grunt shell to enter commands. Instead, you will enter your script in a text file. Start by opening the `gedit` text editor using the shortcut provided on the left-hand toolbar of your VM.

2.2. Click the Save button and save the new, empty file as `join.pig` in the `devph/labs/Lab6.2` folder:

Lester Martin Jr. 11/3/2015 4:15 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:15 PM

Formatted: No bullets or numbering

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

Lester Martin Jr. 10/28/2015 5:05 PM

Deleted: hadoop fs -

Lester Martin Jr. 10/28/2015 5:05 PM

Deleted: hadoop fs -

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

2.3. At the top of the file, add a comment:

```
--join.pig: joins congress.txt and visits.txt
```

Step 3: Load the White House Visitors

3.1. Define the following visitors relations, which will contain the first and last names of all White House visitors:

```
visitors = LOAD 'whitehouse/visits.txt' USING PigStorage(',') AS  
(lname:chararray, fname:chararray);
```

That is the only data we are going to use from visits.txt.

Step 4: Define a Projection of the Congress Data

4.1. Add the following load command that loads the 'congress.txt' file into a relation named `congress`. The data is tab-delimited, so no special Pig loader is needed:

```
congress = LOAD 'whitehouse/congress.txt' AS (  
  full_title:chararray,  
  district:chararray,  
  title:chararray,  
  fname:chararray,  
  lname:chararray,  
  party:chararray  
);
```

- 4.2. The names in `visits.txt` are all uppercase, but the names in `congress.txt` are not. Define a projection of the `congress` relation that consists of the following fields:

```
congress_data = FOREACH congress GENERATE
  district,
  UPPER(lname) AS lname,
  UPPER(fname) AS fname,
  party;
```

Step 5: Join the Two Datasets

- 5.1. Define a new relation named `join_contact_congress` that is a JOIN of `visitors` and `congress_data`. Perform the join on both the first and last names.

- 5.2. Use the `STORE` command to store the result of `join_contact_congress` into a directory named `'joinresult'`.

Solution:

```
join_contact_congress = JOIN visitors BY (lname, fname),
                          congress_data BY (lname, fname);
STORE join_contact_congress INTO 'joinresult';
```

Step 6: Run the Pig Script

- 6.1. Save your changes to `join.pig`.

- 6.2. Open a Terminal window and change directories to the Joining Datasets lab folder:

```
# cd ~/devph/labs/Lab6.2
```

- 6.3. Run the script using the following command:

```
# pig join.pig
```

- 6.4. Wait for the MapReduce job to execute. When it is finished, write down the number of seconds it took for the job to complete (by subtracting the `StartedAt` time from the `FinishedAt` time) and write down the result: _____

- 6.5. The type of join used is also output in the job statistics. Notice the statistics output has "HASH_JOIN" underneath the "Features" column, which means a hash join was used to join the two datasets.

Step 7: View the Results

- 7.1. The output will be in the `joinresult` folder in HDFS. Verify that the folder was created:

```
# hdfs dfs -ls -R joinresult
-rw-r--r--  1 root root          0 joinresult/_SUCCESS
-rw-r--r--  1 root root    40892 joinresult/part-r-00000
```

- 7.2. View the resulting file:

```
# hdfs dfs -cat joinresult/part-r-00000
```

The output should look like the following:

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

Lester Martin Jr. 11/11/2015 8:54 AM

Deleted: 3

Lester Martin Jr. 11/11/2015 8:54 AM

Deleted: 3

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

```
DUFFY SEAN WI07 DUFFY SEAN Republican
JONES WALTER NC03 JONES WALTER Republican
SMITH ADAM WA09 SMITH ADAM Democrat
CAMPBELL JOHN CA45 CAMPBELL JOHN Republican
CAMPBELL JOHN CA45 CAMPBELL JOHN Republican
SMITH ADAM WA09 SMITH ADAM Democrat
```

Step 8: Try Using Replicated on the Join

8.1. Delete the `joinresult` directory in HDFS:

```
# hdfs dfs -rm -R joinresult
```

8.2. Modify your `JOIN` statement in `join.pig` so that it uses replication. It should look like this:

```
join_contact_congress = JOIN visitors BY (lname, fname),
                        congress_data BY (lname, fname) USING 'replicated';
```

8.3. Save your changes to `join.pig` and run the script again.

```
# pig join.pig
```

8.4. Notice this time that the statistics output shows Pig used a “`REPLICATED_JOIN`” instead of a “`HASH_JOIN`”.

8.5. Compare the execution time of the `REPLICATED_JOIN` vs. the `HASH_JOIN`. Did you have any improvement or decrease in performance?

NOTE: Using replicated does not necessarily increase the join time. There are way too many factors involved, and this example is using small datasets. The point is that you should try both techniques (if one dataset is small enough to fit in memory) and determine which join algorithm is faster for your particular dataset and use case.

Step 9: Count the Results

9.1. In `join.pig`, comment out the `STORE` command:

```
--STORE join_contact_congress INTO 'joinresult';
```

You have already saved the output of the `JOIN`, so there is no need to perform the `STORE` command again.

9.2. Notice in the output of your `join.pig` script that we know which party the visitor belongs to: Democrat, Republican, or Independent. Using the `join_contact_congress` relation as a starting point, see if you can figure out how to output the number of Democrat, Republican, and Independent members of Congress that visited the White House. Name the relation counters and use the `DUMP` command to output the results:

```
join_group = GROUP join_contact_congress
              BY congress_data::party;
counters = FOREACH join_group GENERATE group,
```

Copyright © 2015, Hortonworks, Inc. All rights reserved.

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # `hadoop fs`

HDP Developer: Apache Pig and Hive

```
COUNT(join_contact_congress);
```

```
DUMP counters;
```

TIP: When you group the `join_contact_congress` relation, group it by the party field of `congress_data`. You will need to use the `::` operator in the `BY` clause. It will look like:

```
congress_data::party
```

9.3. The correct results are shown here:

```
(Democrat,637)
(Republican,351)
(Independent,2)
```

Step 10: Use the `EXPLAIN` Command

10.1. At the end of `join.pig`, add the following statement:

```
EXPLAIN counters;
```

If you do not have a `counters` relation, then use `join_contact_congress` instead.

10.2. Run the script again. The Logical, Physical, and MapReduce plans should display at the end of the output.

10.3. How many MapReduce jobs did it take to run this job? _____

Answer: Two MapReduce jobs: the first job only requires a map phase, and the second job has a map, a combine and a reduce phase.

Result: You should have a folder in HDFS named `joinresult` that contains a list of members of Congress who have visited the White House (within the timeframe of the historical data in `visits.txt`).

Lab: Preparing Data for Hive

This lab explores transforming and exporting a dataset for use with Hive.

Objective:	Transform and export a dataset for use with Hive.
File locations:	/root/devph/labs/Lab6.3
Successful outcome:	The resulting Pig script stores a projection of visits.txt in a folder in the Hive warehouse named wh_visits.
Before you begin:	You should have visits.txt in a folder named whitehouse in HDFS.
Related lesson:	Advanced Pig Programming

Perform the following steps:

Step 1: Review the Pig Script

- 1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".
- 1.2. Change directories to the Preparing Data for Hive lab folder:

```
# cd ~/devph/labs/Lab6.3/
```

- 1.3. View the contents of wh_visits.pig:

```
# more wh_visits.pig
```

- 1.4. Notice that all White House visitors who met with the President are the `potus` relation.
- 1.5. Notice that the `project_potus` relation is a projection of the last name, first name, time of arrival, location, and comments from the visit.

Step 2: Store the Projection in the Hive Warehouse

- 2.1. Open `wh_visits.pig` with the `gedit` text editor.
- 2.2. Add the following command at the bottom of the file, which stores the `project_potus` relation into a very specific folder in the Hive warehouse:

```
STORE project_potus INTO '/apps/hive/warehouse/wh_visits/';
```

Step 3: Run the Pig Script

- 3.1. Save your changes to `wh_visits.pig`.
- 3.2. Run the script from the command line:

```
# pig wh_visits.pig
```

Lester Martin Jr. 11/3/2015 4:16 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:16 PM

Formatted: No bullets or numbering

Lester Martin Jr. 11/6/2015 11:45 AM

Deleted: From a command prompt, c

Step 4: View the Results

4.1. The `wh_visits.pig` script creates a directory in the Hive warehouse named `wh_visits`. Use `ls` to view its contents:

```
# hdfs dfs -ls /apps/hive/warehouse/wh_visits/
-rw-r--r-- 1 root hdfs 0 /apps/hive/warehouse/wh_visits/_SUCCESS
-rw-r--r-- 1 root hdfs 971339 /apps/hive/warehouse/wh_visits/part-m-00000
-rw-r--r-- 1 root hdfs 142850 /apps/hive/warehouse/wh_visits/part-m-00001
```

4.2. View the contents of one of the result files. It should look like the following:

```
hdfs dfs -cat /apps/hive/warehouse/wh_visits/part-m-00000
...
FRIEDMAN THOMAS 10/12/2010 12:08 WH PRIVATE LUNCH
BASS EDWIN 10/18/2010 15:01 WH
BLAKE CHARLES 10/18/2010 15:00 WH
OGLETREE CHARLES 10/18/2010 15:01 WH
RIVERS EUGENE 10/18/2010 15:01 WH
```

Result: You now have a folder in the Hive warehouse named `wh_visits` that contains a projection of the data in `visits.txt`. We will use this file in an upcoming Hive lab.

Demonstration: Computing PageRank

This lab explores how to use the PageRank UDF in DataFu.

Objective:	To understand how to use the PageRank UDF in DataFu.
During this demonstration:	Watch as your instructor performs the following steps.
Related lesson:	Advanced Pig Programming

Perform the following steps:

Step 1: View the Data

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. Review the edges.txt file in the `/root/devph/labs/demos` folder:

```
# cd ~/devph/labs/demos/
# more edges.txt
0      2      3      1.0
0      3      2      1.0
0      4      1      1.0
0      4      2      1.0
0      5      4      1.0
0      5      2      1.0
0      5      6      1.0
0      6      5      1.0
0      6      2      1.0
0      100     2      1.0
0      100     5      1.0
0      101     2      1.0
0      101     5      1.0
0      102     2      1.0
0      102     5      1.0
0      103     5      1.0
0      104     5      1.0
```

1.3. The first column is the topic, but since we only have a single graph, the topic is 0 for all of the edges.

1.4. The second and third columns are the source and destination of each edge. For example, there is an edge from 2 to 3 based on the first row.

1.5. The fourth column is the weight of the edge. Our graph is all evenly weighted.

1.6. Based on the data above, which pages should be ranked toward the top?

Lester Martin Jr. 11/3/2015 4:16 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:16 PM

Formatted: No bullets or numbering

HDP Developer: Apache Pig and Hive

Answer: It looks like 2 and 5 should end up toward the top.

Step 2: Put the Data in HDFS

2.1. Put edges.txt into HDFS:

```
# hdfs dfs -put edges.txt
```

Step 3: Define the PageRank UDF

3.1. Install DataFu:

```
yum -y install datafu
```

3.2. View the contents of `/root/devph/labs/demos/pagerank.pig` using `gedit`. The first two lines register the DataFu library and define the PageRank function (YOU DO NOT NEED TO TYPE ANYTHING - THE LINES BELOW MERELY DISCUSS WHAT IS ALREADY IN THE SCRIPT):

```
register /usr/hdp/current/pig-client/lib/datafu.jar;  
define PageRank datafu.pig.linkanalysis.PageRank();
```

3.3. The edges are loaded and grouped by topic and source:

```
topic_edges = LOAD '/user/root/edges.txt' as  
              (topic:INT,source:INT,dest:INT,weight:DOUBLE);  
topic_edges_grouped = GROUP topic_edges by (topic, source);
```

3.4. The data is then prepared for the PageRank function, which is expecting a topic, a source, and its edges:

```
topic_edges_data = FOREACH topic_edges_grouped GENERATE  
                  group.topic as topic,  
                  group.source as source,  
                  topic_edges.(dest,weight) as edges;
```

3.5. We only have one topic, but the edges still need to be grouped by topic:

```
topic_edges_data_by_topic = GROUP topic_edges_data  
                            BY topic;
```

3.6. We can now invoke the PageRank function:

```
topic_ranks = FOREACH topic_edges_data_by_topic GENERATE  
              group as topic,  
              FLATTEN(PageRank(topic_edges_data.(source,edges)));
```

3.7. The results are stored in HDFS:

```
store topic_ranks into 'topicranks';
```

Step 4: Run the Script

4.1. From the command prompt, enter:

```
# pig pagerank.pig
```

The job will take a couple of minutes to run.

Step 5: View the Results

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

Lester Martin Jr. 11/10/2015 3:44 PM

Deleted: root/devph/labs/Lab6.5

Lester Martin Jr. 11/3/2015 5:17 PM

Deleted: -1.2.0

HDP Developer: Apache Pig and Hive

5.1. View the contents of the `topicranks` folder in HDFS:

```
# hdfs dfs -ls topicranks
Found 2 items
-rw-r--r--  3 root root          0 topicranks/_SUCCESS
-rw-r--r--  3 root root    181 topicranks/part-r-00000
```

5.2. View the contents of the output file:

```
# hdfs dfs -cat topicranks/part-r-00000
0      104  0.013636362
0       1  0.02764593
0     103  0.013636362
0       5  0.06821412
0     100  0.013636362
0     102  0.013636362
0       6  0.032963693
0       3  0.2891899
0       2  0.32418048
0       4  0.032963693
0     101  0.013636362
```

Step 6: Analyze the Results

6.1. Which page should be ranked the highest? _____

Answer: Page 2

6.2. Which page should be ranked the lowest? _____

Answer: Pages 100 to 104 all ranked equally at the bottom.

6.3. Compare the actual results with your guess from Step 1.

Lab: Analyzing Clickstream Data

This lab explores using the DataFu library to sessionize clickstream data.

Objective:	Become familiar with using the DataFu library to sessionize clickstream data.
File locations:	/root/devph/labs/Lab6.4
Successful outcome:	You will have computed the length of each session along with the average and median values of all session lengths.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Advanced Pig Programming

Perform the following steps:

Step 1: View the Clickstream Data

1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".

1.2. If not already done as part of the prior demonstration, install DataFu:

```
yum -y install datafu
```

1.3. Open a Terminal and change directories to ~/devph/labs/Lab6.4.

```
# cd ~/devph/labs/Lab6.4
```

1.4. View the contents of clicks.csv:

```
# more clicks.csv
```

The first column is the user's ID, the second column is the time of the click stored as a long, and the third column is the URL visited. Enter "q" to quit the more command.

1.5. Put the file in HDFS:

```
# hdfs dfs -put clicks.csv
```

Step 2: Define the Sessionize UDF

2.1. Using the gedit text editor, open the file

```
/root/devph/labs/Lab6.4/sessions.pig.
```

2.2. Notice two JAR files are registered: datafu.jar and piggybank.jar. The datafu JAR contains the Sessionize function that you are going to use, and the piggybank.jar contains a time-utility function named UnixToISO, which is already defined for you in this Pig script.

Lester Martin Jr. 11/3/2015 4:16 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:16 PM

Formatted: No bullets or numbering

Deleted: 2

Lester Martin Jr. 11/11/2015 9:09 AM

Formatted: Font:Bold, Italic

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

Lester Martin Jr. 11/3/2015 5:23 PM

Deleted: -1.2.0

2.3. Add the following `DEFINE` statement to define the `Sessionize` UDF:

```
DEFINE Sessionize datafu.pig.sessions.Sessionize('8m');
```

2.4. What does the '8m' mean in the constructor? _____

Answer: The '8m' stands for eight minutes, which is the length of the session. You can pick any length of time you want to define your sessions.

Step 3: Sessionize the Clickstream

3.1. Notice the `clicks.csv` file is loaded for you in `sessions.pig`:

```
clicks = LOAD 'clicks.csv' USING PigStorage(',')
        AS (id:int, time:long, url:chararray);
```

3.2. Notice also that the `clicks` relation is projected onto `clicks_iso` with the long converted to an ISO time format then grouped by id in the `clicks_group` relation:

```
clicks_iso = FOREACH clicks GENERATE UnixToISO(time)
             AS isotime, time, id;
clicks_group = GROUP clicks_iso BY id;
```

3.3. Sessionize the clickstream by adding the following nested `FOREACH` loop:

```
clicks_sessionized = FOREACH clicks_group {
    sorted = ORDER clicks_iso BY isotime;
    GENERATE FLATTEN(Sessionize(sorted))
    AS (isotime, time, id, sessionid);
};
```

3.4. Dump the `sessionized` data:

```
DUMP clicks_sessionized;
```

3.5. Save your changes to `sessions.pig`.

Step 4: Run the Script

4.1. Let's verify that the `Sessionized` function is working by running the script:

```
# pig sessions.pig
```

4.2. Verify that the tail of the output looks similar to the following:

```
(2013-01-10T07:15:20.520Z,1357802120520,2,51d89b38-b14a-4158-8703-724525d9f787)

e2ad5ec555e5)
```

Step 5: Compute the Session Length

5.1. Comment out the dump statement:

```
--DUMP clicks_sessionized
```

5.2. Add code to define a projection named `sessions` that is a projection of only the time and `sessionid` fields of the `clicks_sessionized` relation.

Solution:

```
sessions = FOREACH clicks_sessionized GENERATE time, sessionid;
```

5.3. Add code to define a relation named `sessions_group` that is the `sessions` relation grouped by `sessionid`.

Solution:

```
sessions_group = GROUP sessions BY sessionid;
```

5.4. Add code to define a `session_times` relation using the following projection that computes the length of each session:

```
session_times = FOREACH sessions_group
GENERATE group as sessionid,
(MAX(session.time) - MIN(session.time)) / 1000.0 / 60
as session_length;
```

5.5. Dump the `session_times` relation:

```
DUMP session_times;
```

5.6. Save your changes to `sessions.pig` and run the script. The output should look like the following:

```
(01e5259c-c5a6-45b0-8d04-1be86182d12e,0.16571666666666665)

(e1ccdf96-fc37-4b7e-9a7c-95acb8f52fa7,0.0)
(fd92f410-19fc-4927-917f-0f86b5d7edb2,17.19768333333333)
(fdacea38-ddf9-477a-bb3e-401e8874e0ac,2.251233333333333)
(ff70c6b5-abb2-4606-b12f-3054501947a4,0.0511833333333333)
```

5.7. How long was the longest session? _____

Answer: The longest session was 86.69525 minutes.

Step 6: Compute the Average Session Length

6.1. Comment out the dump statement:

```
--DUMP session_times;
```

6.2. Define a relation named `sessiontimes_all` that is a grouping of all `session_times`.

```
sessiontimes_all = GROUP session_times ALL;
```

6.3. Define `sessiontimes_avg` using the following nested `FOREACH` statement:

```
sessiontimes_avg = FOREACH sessiontimes_all
    GENERATE AVG(session_times.session_length);
```

6.4. Dump the `sessiontimes_avg` relation:

```
DUMP sessiontimes_avg;
```

6.5. Save your changes to `sessions.pig` and run the script again.

6.6. Verify the output, which should be a single value representing the average session time:

```
(11.88608076923077)
```

Step 7: Compute the Median Session Length

7.1. Using the `sessiontimes_avg` relation as an example, compute the median session time. You will need to define the Median function from the DataFu library, which is named `datafu.pig.stats.Median()`.

Solution: A quick solution for computing the median is to simply add it to the existing nested `FOREACH` statement in the `sessiontimes_avg` definition:

```
--ADD to the top of the file

DEFINE Median datafu.pig.stats.Median();

--MODIFY sessiontimes_avg definition

sessiontimes_avg = FOREACH sessiontimes_all {
    ordered = ORDER session_times BY session_length;
    GENERATE
        AVG(ordered.session_length) AS avg_session,
        Median(ordered.session_length) AS median_session;
};
```

7.2. Verify that you got the following value for the median session length:

```
(1.9482833333333334)
```

Result: You have taken clickstream data and sessionized it using Pig to determine statistical information about the sessions, like the length of each session and the average and median lengths of all sessions.

Lab: Analyzing Stock Market Data using Quantiles

This lab explores using the DataFu library to compute quantiles.

Objective:	Use DataFu to compute quantiles.
File locations:	/root/devph/labs/Lab6.5
Successful outcome:	You will have computed quartiles for the daily high prices of stocks traded on the New York Stock Exchange.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM and DataFu should have been installed via "yum -y install datafu".
Related lesson:	Advanced Pig Programming

Perform the following steps:

Step 1: Review the Stock Market Data

1.1. **O** If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. **C**hange directories to the `~/devph/labs/Lab6.5` folder.

```
# cd ~/devph/labs/Lab6.5
```

1.3. View the contents of the `stocks.csv` file, which contains the historical prices for New York Stock Exchange stocks that begin with the letter "Y":

```
# tail stocks.csv
NYSE,YSI,2004-11-23,17.35,17.48,16.90,17.26,207400,13.26
NYSE,YSI,2004-11-22,17.20,17.43,16.90,17.35,204100,13.33
NYSE,YSI,2004-11-19,17.20,17.45,16.85,17.45,304100,13.41
NYSE,YSI,2004-11-18,17.40,17.45,17.10,17.11,180900,13.14
NYSE,YSI,2004-11-17,17.16,17.77,17.15,17.35,320400,13.33
NYSE,YSI,2004-11-16,17.20,17.33,17.05,17.15,245000,13.18
NYSE,YSI,2004-11-15,16.95,17.20,16.90,17.20,174400,13.21
NYSE,YSI,2004-11-12,17.05,17.14,16.99,17.00,359900,13.06
NYSE,YSI,2004-11-11,16.92,17.04,16.81,17.00,263800,13.06
NYSE,YSI,2004-11-10,16.90,17.05,16.80,17.00,243300,13.06
```

The first column is always "NYSE." The second column is the stock's symbol. The third column is the date that the prices occurred. The next columns are the open, high, low, close, and trading volume.

1.4. Put `stocks.csv` into your `/user/root` folder in HDFS (if you already have a `stocks.csv` file in your HDFS home directory from exercising the block storage demonstration, please delete the existing file first, as the contents are different):

Lester Martin Jr. 10/19/2015 9:30 PM

Formatted: Font:Italic

HDP Developer: Apache Pig and Hive

```
# hdfs dfs -put stocks.csv
```

Step 2: Define the Quantile Function

2.1. Using `gedit`, create a new text file in the `/root/devph/labs/Lab6.5` lab folder named `quantile.pig`.

2.2. On the first line of the file, register the `datafu` JAR file [which you installed in the prior lab](#).

```
register /usr/hdp/current/pig-client/lib/datafu.jar;
```

2.3. Define the `datafu.pig.stats.Quantile` function as a quantile, and pass in the values for computing the quartiles of a set of numbers:

```
define Quantile datafu.pig.stats.Quantile(  
    '0.0', '0.25', '0.50', '0.75', '1.0');
```

Step 3: Load the Stocks

3.1. Enter the following `LOAD` command, which loads the first five values of each row:

```
stocks = LOAD 'stocks.csv' USING PigStorage(',') AS  
    (nyse:chararray,  
    symbol:chararray,  
    closingdate:chararray,  
    openprice:double,  
    highprice:double,  
    lowprice:double);
```

Step 4: Filter Null Values

4.1. The quantile function fails if any of the values passed to it are null. Define a relation named `stocks_filter` that filters the `stocks` relation where the `highprice` is not null.

Solution:

```
stocks_filter = FILTER stocks BY highprice is not null;
```

Step 5: Group the Values

5.1. We want to compute the quantiles for each individual stock (as opposed to all the stock prices that start with a "Y"), so define a relation named `stocks_group` that groups the `stocks_filter` relation by `symbol`.

Solution:

```
stocks_group = GROUP stocks_filter BY symbol;
```

Step 6: Compute the Quantiles

6.1. Define the following relation that invokes the `Quantile` method on the `highprice` values:

```
quantiles = FOREACH stocks_group {  
    sorted = ORDER stocks_filter BY highprice;  
    GENERATE group AS symbol,  
    Quantile(sorted.highprice) AS quant;
```

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # `hadoop fs`

Lester Martin Jr. 11/10/2015 3:44 PM

Formatted: Font:(Default) Courier New, 10 pt

Lester Martin Jr. 11/3/2015 5:28 PM

Deleted: -1.2.0

```
};
```

6.2. How many times will the quantile function be invoked in the nested `FOREACH` statement above? _____

Answer: The `FOREACH` statement iterates over the `stocks_group`, which is a grouping by symbol. So the quantile function will be invoked once for each unique stock symbol in the `stocks.csv` file.

6.3. Add a `DUMP` statement that outputs the quantiles relation:

```
DUMP quantiles;
```

Step 7: Run the Script

7.1. Save your changes to `quantile.pig`.

7.2. Run the script:

```
# pig quantile.pig
```

7.3. There is stock information in the input data, so the output will be the quantiles of the high price of these five stocks:

```
(YGE, (3.22,10.97,14.79,19.6,41.5))
(YPF, (9.0,23.62,31.94,41.47,69.98))
(YSI, (1.56,8.04,16.435000000000002,19.93,23.61))
(YUM, (21.9,32.08,37.85,48.91,73.87))
(YZC, (4.41,14.4,20.795,47.13,116.73))
```

Step 8: Compute the Median

8.1. Now that you have a working Pig script for computing the quantiles of the high prices of stocks, see if you can modify the script (you only have to make a few changes) to compute the median value of the high prices.

Solution:

1) Change the `define` statement to the following:

```
define Median datafu.pig.stats.Median();
```

2) Change the `quantiles` definition to a `medians` definition as follows:

```
medians = FOREACH stocks_group {
    sorted = ORDER stocks_filter BY highprice;
    GENERATE group AS symbol,
             Median(sorted.highprice) AS median;
};
```

3) Change the `DUMP` command to display `medians`:

```
DUMP medians;
```

4) Save the modified file as `median.pig`

5) Run the modified script and view the results

HDP Developer: Apache Pig and Hive

```
# pig median.pig
```

5) The output will be the median values for the same five stocks:

```
(YGE, (14.79))  
(YPF, (31.94))  
(YSI, (16.435000000000002))  
(YUM, (37.85))  
(YZC, (20.795))
```

Result: You have used the DataFu library to compute the quantiles of a collection of numbers using Pig.

Lab: Understanding Hive Tables

This lab explores how Hive table data is stored in HDFS.

Objective:	Understand how Hive table data is stored in HDFS.
File locations:	/root/devph/labs/7.1
Successful outcome:	A new Hive table filled with the data from the wh_visits folder.
Before you begin:	Complete the Preparing Data for Hive lab, or put the data from the solution of that lab into HDFS.
Related lesson:	Hive Programming

Perform the following steps:

Step 1: Review the Data

1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".

1.2. Use the `hdfs dfs -ls` command to view the contents of the `/apps/hive/warehouse/wh_visits/` folder in HDFS that was created in an earlier lab. You should see six `part-m` files:

```
# hdfs dfs -ls /apps/hive/warehouse/wh_visits/
```

1.3. Recall that the Pig projection to create these files had the following schema (no typing necessary - this is reprinted below for reference only):

```
project_potus = FOREACH potus GENERATE
  $0 AS lname:chararray,
  $1 AS fname:chararray,
  $6 AS time_of_arrival:chararray,
  $11 AS appt_scheduled_time:chararray,
  $21 AS location:chararray,
  $25 AS comment:chararray ;
```

In this lab, you will define a Hive table that matches these records and contains the exported data from your Pig script.

Step 2: Define a Hive Script

2.1. In the Understanding `/root/devph/labs/Lab7.1` folder, there is a text file named `wh_visits.hive`. View its contents. Notice that it defines a Hive table named `wh_visits` with the following schema that matches the data in your `project_potus` folder:

```
# cd ~/devph/labs/Lab7.1
```

Lester Martin Jr. 11/3/2015 4:17 PM

Lester Martin Jr. 10/19/2015 9:56 PM

Deleted: two

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

```
# more wh_visits.hive
create table wh_visits (
  lname string,
  fname string,
  time_of_arrival string,
  appt_scheduled_time string,
  meeting_location string,
  info_comment string)
ROW FORMAT DELIMITED
FIELDS TERMINATED BY '\t' ;
```

NOTE: You cannot use comment or location as column names because those are reserved Hive keywords, so we changed them slightly.

2.2. Run the script with the following command:

```
# hive -f wh_visits.hive
```

2.3. If successful, you should see “ok” in the output along with the time it took to run the query.

Step 3: Verify the Table Creation

3.1. Start the Hive Shell:

```
# hive
```

3.2. From the hive> prompt, enter the “show tables” command:

```
hive> show tables;
```

You should see `wh_visits` in the list of tables.

3.3. Use the describe command to view the details of `wh_visits`:

```
hive> describe wh_visits;
OK
lname                string
fname                string
time_of_arrival      string
appt_scheduled_time  string
meeting_location     string
info_comment         string
```

3.4. Try running a query (even though the table is empty):

```
hive> select * from wh_visits limit 20;
```

You should see 20 rows returned. How is this brand new Hive table already populated with records? _____

Lester Martin Jr. 10/19/2015 9:58 PM

Deleted: .

Lester Martin Jr. 10/19/2015 9:58 PM

Deleted: .

Lester Martin Jr. 10/19/2015 9:58 PM

Deleted: .

Lester Martin Jr. 10/19/2015 9:58 PM

Deleted: .

Answer: In a previous lab, you already populated the `/apps/hive/warehouse/wh_visits` folder with the output of a Pig job.

3.5. Why did the previous query not require a Tez or MapReduce job to execute?

Answer: The query selected all columns and did not contain a `WHERE` clause, the query just needs to read in the data from the file and display it.

Step 4: Count the Number of Rows in a Table

4.1. Enter the following Hive query, which outputs the number of rows in `wh_visits`:

```
hive> select count(*) from wh_visits;
```

4.2. How many rows are currently in `wh_visits`? _____

Answer: 21,819

Step 5: Selecting the Input File Name

5.1. Hive has two virtual columns that get created automatically for every table:

`INPUT__FILE__NAME` and `BLOCK__OFFSET__INSIDE__FILE`.

Note that between each word in the column name there are **two** underscore characters, not just one. You must make sure you type both of them when using these columns in a hive command.

You can use these column names in your queries just like any other column of the table. To demonstrate, run the following query:

```
hive> select INPUT__FILE__NAME, lname, fname FROM wh_visits WHERE lname LIKE 'Y%';
```

5.2. The result of this query is visitors to the White House whose last name starts with “Y.” Notice that the output also contains the particular file that the record was found in:

```
hdfs://sandbox.hortonworks.com:8020/apps/hive/warehouse/wh_visits/part-m-00000 YOUNG MICHELLE
hdfs://sandbox.hortonworks.com:8020/apps/hive/warehouse/wh_visits/part-m-00001 YOUNG LEDISI
```

Step 6: Drop a Table

6.1. Let’s see what happens when a managed table is dropped. Start by defining a simple table called `names` using the Hive Shell:

```
hive> create table names (id int, name string)
ROW FORMAT DELIMITED FIELDS TERMINATED BY '\t';
```

6.2. Use the Hive `dfs` command to put `Lab7.1/names.txt` into the table’s warehouse folder:

```
hive> dfs -put /root/devph/labs/Lab7.1/names.txt /apps/hive/warehouse/names/;
```

6.3. View the contents of the table's warehouse folder:

```
hive> dfs -ls /apps/hive/warehouse/names;  
Found 1 items  
root hdfs      78 /apps/hive/warehouse/names/names.txt
```

6.4. From the Hive Shell, run the following query:

```
hive> select * from names;  
OK  
0      Rich  
1      Barry  
2      George  
3      Ulf  
4      Danielle  
5      Tom  
6      manish  
7      Brian  
8      Mark
```

6.5. Now drop the names table:

```
hive> drop table names;
```

6.6. View the contents of the table's warehouse folder again. Notice the names folder is gone:

```
hive> dfs -ls /apps/hive/warehouse/names;  
ls: '/apps/hive/warehouse/names': No such file or directory
```

IMPORTANT: Be careful when you drop a managed table in Hive. Make sure you either have the data backed up somewhere else or that you no longer want the data.

Step 7: Define an External Table

7.1. In this step you will see how external tables work in Hive. Start by putting names.txt into HDFS:

```
hive> dfs -put /root/devph/labs/Lab7.1/names.txt names.txt;
```

7.2. Create a folder in HDFS for the external table to store its data in:

```
hive> dfs -mkdir hivedemo;
```

7.3. Define the names table as external this time:

```
hive> create external table names (id int, name string)  
ROW FORMAT DELIMITED FIELDS TERMINATED BY '\t'  
LOCATION '/user/root/hivedemo';
```

7.4. Load data into the table:

```
hive> load data inpath '/user/root/names.txt' into table names;
```

7.5. Verify that the load worked:

```
hive> select * from names;
```

7.6. Notice the names.txt file has been moved to `/user/root/hivedemo`:

```
hive> dfs -ls hivedemo;
Found 1 items
-rw-r--r-- 1 root hdfs      78 hivedemo/names.txt
```

7.7. Similarly, verify that names.txt is no longer in your `/user/root` folder in HDFS.

```
hive> dfs -ls /user/root/names.txt;
```

Why is it gone? _____

Answer: The `LOAD` command moved the file from `/user/root` to `/user/root/names`. The `LOAD` command does not copy files; it moves them.

7.8. Use the `ls` command to verify that the `/apps/hive/warehouse` folder does not contain a subfolder for the names table.

```
hive> dfs -ls /apps/hive/warehouse;
```

7.9. Now drop the names table:

```
hive> drop table names;
```

7.10. View the contents of `/user/root/hivedemo`. Notice that names.txt is still there.

```
hive> dfs -ls /user/root/hivedemo;
```

Result: As you just verified, the data for external tables is not deleted when the corresponding table is dropped. Aside from this behavior, managed tables and external tables in Hive are essentially the same. You now have a table in Hive named `wh_visits` that was loaded from the result of a Pig job. You also have an external table called `names` that stores its data in `/user/root/hivedemo`. At this point, you should have a pretty good understanding of how Hive tables are created and populated.

Demonstration: Understanding Partitions and Skew

This lab explores how Hive partitioning and skewed tables work.

Objective:	To understand how Hive partitioning and skewed tables work.
During this Demonstration:	Watch as your instructor performs the following steps.
Related lesson:	Hive Programming

Perform the following steps:

Step 1: View the Data

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. Review the `hivedata_<<state>>.txt` files in `/root/devph/labs/demos`. This will be the data added to the table.

Step 2: Define the Table in Hive

2.1. View the create table statement in `partitiondemo.sql`:

```
# cd ~/devph/labs/demos
# more partitiondemo.sql
drop table if exists names;
create table names (id int, name string)
  partitioned by (state string)
  row format delimited fields terminated by '\t';
```

2.2. Run the query to define the names table:

```
# hive -f partitiondemo.sql
```

2.3. Show the partitions (there won't be any yet):

```
# hive
hive> show partitions names;
```

Step 3: Load Data into the Table

3.1. When you load data into a partitioned table, you specify which partition the data goes into. For example:

```
hive> load data local inpath '/root/devph/labs/demos/hivedata_ca.txt'
into table names partition (state = 'CA');
```

3.2. Load the `CO` and `SD` files also:

```
hive> load data local inpath '/root/devph/labs/demos/hivedata_co.txt'
```

Lester Martin Jr. 11/3/2015 4:17 PM

Deleted: *About this Lab*

Lester Martin Jr. 11/3/2015 4:17 PM

Formatted: No bullets or numbering

```
into table names partition (state = 'CO');
load data local inpath '/root/devph/labs/demos/hivedata_sd.txt'
into table names partition (state = 'SD');
```

3.3. Verify that all of the data made it into the names table:

```
hive> select * from names;
OK
1      Ulf      CA
2      Manish  CA
3      Brian   CA
4      George  CO
5      Mark    CO
6      Rich    SD
```

Step 4: View the Directory Structure

4.1. [List the partitions and view the contents of /apps/hive/warehouse/names:](#)

```
hive> show partitions names;
OK
state=CA
state=CO
state=SD

hive> dfs -ls -R /apps/hive/warehouse/names/;
0  /apps/hive/warehouse/names/state=CA
24 /apps/hive/warehouse/names/state=CA/hivedata_ca.txt
0  /apps/hive/warehouse/names/state=CO
16 /apps/hive/warehouse/names/state=CO/hivedata_co.txt
0  /apps/hive/warehouse/names/state=SD
6  /apps/hive/warehouse/names/state=SD/hivedata_sd.txt
```

4.2. Notice that each partition has its own subfolder for storing its contents.

Step 5: Perform a Query

5.1. When you specify a where clause that includes a partition, Hive is smart enough to only scan the files in that partition. For example:

```
hive> select * from names where state = 'CA';
OK
1      Ulf      CA
2      Manish  CA
3      Brian   CA
```

5.2. Notice that a MapReduce job was not executed. Why? _____

Answer: The result of the query is exactly the contents of the underlying files, so there is no need to run a MapReduce job. The files can simply be read and displayed.

5.3. You can select the `partition` field, even though it is not actually in the data file. Hive uses the directory name to retrieve the value:

Lester Martin Jr. 11/11/2015 9:58 AM

Deleted: V

```
hive> select name, state from names where state = 'CA';
```

5.4. You can still run queries across the entire dataset. For example, the following query spans multiple partitions. When you are done, use `quit` to exit the Hive shell.:

```
hive> select name, state from names where state = 'CA' or state = 'SD';
```

```
hive> quit;
```

Step 6: Create a Skewed Table

6.1. Verify the existence of the `salaries.txt` folder in `~/devph/labs/demos/` and then put it into the `/user/root/salarydata/` folder in HDFS.

```
# ls salaries.txt
```

```
# hdfs dfs -put salaries.txt /user/root/salarydata/salaries.txt
```

6.2. View the contents of `demos/skewdemo.hive`, which defines a skewed table named `skew_demo` using the `salaries.txt` data:

```
# more skewdemo.hive
```

6.3. Which values are skewing this table? _____

Answer: The skewed values are the 95102 and 94040 zip codes.

Run the `skewdemo.hive` script:

```
# hive -f skewdemo.hive
```

6.4. View the contents of the underlying Hive warehouse folder:

```
# hdfs dfs -ls -R /apps/hive/warehouse/skew_demo
```

6.5. Select a few records to make sure the table has data behind it:

```
# hive -f show_skewdemo.hive
```

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

Lab: Analyzing Big Data with Hive

This lab explores techniques to analyze Big Data, using public visitor data from the White House.

Objective:	Analyze the White House visitor data.
File locations:	/root/devph/labs/Lab7.2
Successful outcome:	You will have discovered several useful pieces of information about the White House visitor data.
Before you begin:	Complete the Understanding Hive Tables Lab.
Related lesson:	Hive Programming

Perform the following steps:

Step 1: Find the First Visit

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. Using `gedit`, create a new text file named `whitehouse.hive` and save it in your `~/devph/labs/Lab7.2` folder.

1.3. In this step, you will instruct the hive script to find the first visitor to the White House (based on our dataset). This will involve some clever handling of timestamps. This will be a long query, so enter it on multiple lines (*note the lack of a ";" at the end of this first step*). Start by selecting all columns where the `time_of_arrival` is not empty:

```
select * from wh_visits where time_of_arrival != ""
```

1.4. To find the first visit, we need to sort the result. This requires converting the `time_of_arrival` string into a timestamp. We will use the `unix_timestamp` function to accomplish this. Add the following order by clause (*again, no ";" at the end of the line*):

```
order by unix_timestamp(time_of_arrival,  
'MM/dd/yyyy hh:mm')
```

1.5. Since we are only looking for one result, we certainly don't need to return every row. Let's limit the result to 10 rows, so we can view the first 10 visitors (*this finishes the query, so will end with the ";" character*):

```
limit 10;
```

1.6. Save your changes to `whitehouse.hive`.

1.7. Execute the script `whitehouse.hive` and wait for the results to be displayed:

```
# cd ~/devph/labs/Lab7.2
```

Lester Martin Jr. 11/3/2015 4:17 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:17 PM

Formatted: No bullets or numbering

```
# hive -f whitehouse.hive
```

1.8. The results should be 10 visitors, and the first visit should be in 2009, since that is when the dataset begins. The first visitors are Charles Kahn and Carol Keehan on 3/5/2009.

Step 2: Find the Last Visit

2.1. This one is easy: just take the previous query and reverse the order by adding `desc` to the order by clause:

```
order by unix_timestamp(time_of_arrival,  
'MM/dd/yyyy hh:mm') desc
```

2.2. Run the query again, and you should see that the most recent visit was Jackie Walker on 3/18/2011.

```
# hive -f whitehouse.hive
```

Step 3: Find the Most Common Comment

3.1. In this step, you will explore the `info_comment` field and try to determine the most common comment. You will use some of Hive's aggregate functions to accomplish this. Start by using `gedit` to create a new text file named `comments.hive` and save it in `~/devph/labs/Lab7.2` folder.

3.2. You will now create a query that displays the 10 most frequently occurring comments. Start with the following select clause:

```
from wh_visits  
select count(*) as comment_count, info_comment
```

This runs the aggregate count function on each group (which you will define later in the query) and names the result `comment_count`. For example, if "OPEN HOUSE" occurs five times then `comment_count` will be five for that group.

Notice we are also selecting the `info_comment` column so we can see what the comment is.

3.3. Group the results of the query by the `info_comment` column:

```
group by info_comment
```

3.4. Order the results by `comment_count`, because we are only interested in comments that appear most frequently:

```
order by comment_count DESC
```

3.5. We only want the top results, so limit the result set to 10:

```
limit 10;
```

3.6. Save your changes to `comments.hive` and execute the script. Wait for the MapReduce job to execute.

```
# hive -f comments.hive
```

Lester Martin Jr. 11/10/2015 3:44 PM
Formatted: Font:(Default) Courier New,
10 pt

3.7. The output will be 10 comments and should look like:

```
9036
1253 HOLIDAY BALL ATTENDEES/
894  WHO EOP RECEP 2
700  WHO EOP 1 RECEPTION/
601  RESIDENCE STAFF HOLIDAY RECEPTION/
586  PRESS RECEPTION ONE (1)/
580  GENERAL RECEPTION 1
540  HANUKKAH RECEPTION./
540  GEN RECEP 5/
516  GENERAL RECEPTION 3
```

3.8. It appears that a blank comment is the most frequent comment, followed by the HOLIDAY BALL, then a variation of other receptions.

3.9. Modify the query so that it ignores empty comments. If it works, the comment "GEN RECEP 6/" will show up in your output.

Solution:

```
--In comments.hive, insert the following line between your select and group
statements:
```

```
where info_comment != ""
```

Save the changes, then back at the command line, re-run the query:

```
# hive -f comments.hive
```

Step 4: Least Frequent Comment

4.1. Run the previous query again, but this time, find the 10 least occurring comments.

```
--Remove DESC from your order statement so that it looks like this:
```

```
order by comment_count
```

Save the changes, then back at the command line, re-run the query:

```
# hive -f comments.hive
```

The output should look [something](#) like:

```
1      CONGRESSIONAL BALL/
1      CONG BALL/
1      merged to u59031
1      CONGRESSIONAL BALL
1      CONG BALL
1      COMMUNITY COLLEGE SUMMIT
1      48 HOUR WAVE EXCEPTION GRANTED
1      DROP BY VISIT
1      WHO EOP/
1      "POTUS LUNCH WITH WASHINGTON
```

This seems accurate since 1 is the least number of times a comment can appear.

Step 5: Analyze the Data Inconsistencies

5.1. Analyzing the results of the most- and least-frequent comments, it appears that several variations of `GENERAL RECEPTION` occur. In this step, you will try to determine the number of visits to the POTUS involving a general reception by trying to clean up some of these inconsistencies in the data.

NOTE: Inconsistencies like these are very common in big data, especially when human input is involved. In this dataset, we likely have different people entering similar comments but using their own abbreviations.

5.2. Modify the query in `comments.hive`. Instead of searching for empty comments. Search for comments that contain variations of the string `"GEN RECEP."`

```
where info_comment rlike '.*GEN.*\\s+RECEP.*'
```

5.3. Change the limit clause from 10 to 30:

```
limit 30;
```

5.4. Run the query again.

```
# hive -f comments.hive
```

5.5. Notice there are several `GENERAL RECEPTION` entries that only differ by a number at the end or use the `GEN RECEP` abbreviation:

```
580 GENERAL RECEPTION 1
540 GEN RECEP 5/
516 GENERAL RECEPTION 3
498 GEN RECEP 6/
438 GEN RECEP 4
31 GENERAL RECEPTION 2
23 GENERAL RECEPTION 3
20 GENERAL RECEPTION 6
20 GENERAL RECEPTION 5
13 GENERAL RECEPTION 1
```

5.6. Let's try one more query to try and narrow `GENERAL RECEPTION` visit. Modify the `WHERE` clause in `comments.hive` to include `"%GEN%"`:

```
where info_comment like "%RECEP%"
and info_comment like "%GEN%"
```

5.7. Leave the limit at 30, save your changes, and run the query again.

```
# hive -f comments.hive
```

5.8. The output this time reveals all the variations of `GEN` and `RECEP`. Next, let's add up the total number of them by running the following query:

```
from wh_visits
```

```
select count(*)
where info_comment like "%RECEP%"
and info_comment like "%GEN%";
```

--Then save your changes and run the query again from the command line:

```
# hive -f comments.hive
```

5.9. Notice there are 2,697 visits to the POTUS with `GEN RECEP` in the comment field, which is about 12% of the 21,819 total visits to the POTUS in our dataset.

NOTE: More importantly, these results show that the conclusion from our first query, where we found that the most likely reason to visit the President was the `HOLIDAY BALL` with 1,253 attendees, is incorrect. This type of analysis is common in big data, and it shows how data analysts need to be creative and thorough when researching their data.

Step 6: Verify the Result

6.1. We have 12% of visitors to the POTUS going for a general reception, but there were a lot of statements in the comments that contained `WHO` and `EOP`. Modify the query from the last step and display the top 30 comments that contain “`WHO`” and “`EOP`.”

--You should be able to undo changes to `comments.hive` and restore it to the state before the last lab. Then make the following two additional edits:

--Change the where clause to match `WHO` and `EOP`

```
where info_comment like "%WHO%"
and info_comment like "%EOP%";
```

--Add the `DESC` command back to the end of the order statement

```
order by comment_count DESC
```

--Finally, double-check `select count()` as `comment_count`, `info_count`
--Make sure the “`as...`” portion is there*

--Then save your changes and run the query again from the command line:

```
# hive -f comments.hive
```

The result should look like:

```
894 WHO EOP RECEP 2
700 WHO EOP 1 RECEPTION/
43 WHO EOP RECEP/
20 WHO EOP HOLIDAY RECEP/
13 WHO/EOP #2/
8 WHO EOP RECEPTION
7 WHO EOP RECEP
```

```
1      WHO EOP/  
1      WHO EOP RECLEAR
```

6.2. Modify the script again, this time to run a query that counts the number of records with `WHO` and `EOP` in the comments, and run the query:

```
from wh_visits  
  select count(*)  
  where info_comment like "%WHO%"  
    and info_comment like "%EOP%";  
  
--Run the query from the command line:  
  
# hive -f comments.hive
```

You should get 1,687 visits, or 7.7% of the visitors to the POTUS. So `GENERAL RECEPTION` still appears to be the most frequent comment.

Step 7: Find the Most Visits

7.1. See if you can write a Hive script that finds the top 20 individuals who visited the POTUS most. Use the Hive command from Step 3 earlier in this lab as a guide.

TIP: Use a grouping by both `fname` and `lname`.

The solution is printed below.

7.2. The following script will accomplish the intention of the previous step:

```
from wh_visits  
  select count(*) as most_visit, fname, lname  
  group by fname, lname  
  order by most_visit DESC  
  limit 20;
```

To verify that your script worked, here are the top 20 individuals who visited the POTUS along with the number of visits (your output may vary slightly due to randomization of names):

```
16      ALAN  PRATHER  
15      CHRISTOPHER  FRANKE  
15      ANNAMARIA  MOTTOLA  
14      ROBERT    BOGUSLAW  
14      CHARLES   POWERS  
12      SARAH  HART  
12      JACKIE   WALKER  
12      JASON  FETTIG  
12      SHENGTSUNG  WANG  
12      FERN   SATO  
12      DIANA  FISH  
11      JANET  BAILEY  
11      PETER  WILSON
```

```
11  GLENN DEWEY
11  MARCIO      BOTELHO
11  DONNA WILLINGHAM
10  DAVID AXELROD
10  CLAUDIA     CHUDACOFF
10  VALERIE     JARRETT
10  MICHAEL     COLBURN
```

Result: You have written several Hive queries to analyze the White House visitor data. The goal is for you to become comfortable with working with Hive, so hopefully you now feel like you can tackle a Hive problem and be able to answer questions about your big data stored in Hive.

Lab: Understanding MapReduce

Lester Martin Jr. 11/11/2015 10:28 AM

Comment [1]: DELETING THIS WHOLE LAB

Lester Martin Jr. 11/11/2015 10:28 AM

Deleted: This lab explores how Hive queries get executed as MapReduce jobs. To understand better how Hive queries get executed as MapReduce jobs. ... [32]

Demonstration: Computing ngrams

This demonstration explores how to compute ngrams using Hive.

Objective:	To understand how to compute ngrams using Hive.
During this demonstration:	Watch as your instructor performs the following steps.
Related lesson:	Hive Programming

Perform the following steps:

Step 1: Create a Hive Table for the Data

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. This demonstration computes ngrams on the U.S. Constitution, which is in a text file in the `/root/devph/labs/demos` folder:

```
# cd ~/devph/labs/demos/  
# more constitution.txt  
  
--press q to exit more
```

1.3. Start the Hive shell and define the following table:

```
# hive  
  
hive> create table constitution (  
    line string  
)  
ROW FORMAT DELIMITED;
```

Each line of text in the text file is going to be a record in our Hive table.

Step 2: Load the Hive Table

2.1. Load `constitution.txt` into the `constitution` table:

```
hive> load data local inpath '/root/devph/labs/demos/constitution.txt' into  
table constitution;
```

2.2. Verify that the data is loaded:

```
hive> select * from constitution;
```

You should see the contents of `constitution.txt` again.

Step 3: Compute a Bigram

Lester Martin Jr. 11/3/2015 4:17 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:17 PM

Formatted: No bullets or numbering

3.1. Enter the following Hive command, which computes a bigram for the Constitution and shows the top 15 results:

```
hive> select explode(ngrams(sentences(line),2,15)) as x
from constitution;
```

The result should look [similar to](#):

```
{"ngram":["of","the"],"estfrequency":194.0}
{"ngram":["shall","be"],"estfrequency":100.0}
{"ngram":["the","United"],"estfrequency":76.0}
{"ngram":["United","States"],"estfrequency":76.0}
{"ngram":["to","the"],"estfrequency":57.0}
{"ngram":["shall","have"],"estfrequency":44.0}
{"ngram":["the","President"],"estfrequency":30.0}
{"ngram":["shall","not"],"estfrequency":29.0}
{"ngram":["in","the"],"estfrequency":28.0}
{"ngram":["by","the"],"estfrequency":25.0}
{"ngram":["the","Congress"],"estfrequency":22.0}
{"ngram":["and","the"],"estfrequency":21.0}
{"ngram":["for","the"],"estfrequency":21.0}
{"ngram":["Vice","President"],"estfrequency":21.0}
{"ngram":["the","Senate"],"estfrequency":21.0}
{"ngram":["States","and"],"estfrequency":20.0}
{"ngram":["States","shall"],"estfrequency":19.0}
{"ngram":["any","State"],"estfrequency":18.0}
{"ngram":["Congress","shall"],"estfrequency":18.0}
{"ngram":["on","the"],"estfrequency":17.0}
```

Step 4: Compute a Trigram

4.1. Run the previous query again, but this time compute a trigram:

```
hive> select explode(ngrams(sentences(line),3,20)) as result from
constitution;
```

4.2. The result should look [similar to](#):

```
{"ngram":["the","United","States"],"estfrequency":68.0}
{"ngram":["of","the","United"],"estfrequency":51.0}
{"ngram":["shall","not","be"],"estfrequency":16.0}
{"ngram":["of","the","Senate"],"estfrequency":14.0}
{"ngram":["States","shall","be"],"estfrequency":13.0}
{"ngram":["House","of","Representatives"],"estfrequency":13.0}
{"ngram":["United","States","shall"],"estfrequency":13.0}
{"ngram":["shall","have","been"],"estfrequency":12.0}
{"ngram":["the","several","States"],"estfrequency":12.0}
{"ngram":["President","of","the"],"estfrequency":11.0}
{"ngram":["United","States","and"],"estfrequency":11.0}
{"ngram":["The","Congress","shall"],"estfrequency":10.0}
{"ngram":["the","House","of"],"estfrequency":10.0}
{"ngram":["United","States","or"],"estfrequency":10.0}
{"ngram":["Congress","shall","have"],"estfrequency":10.0}
{"ngram":["the","Vice","President"],"estfrequency":9.0}
{"ngram":["of","the","President"],"estfrequency":8.0}
```

Lester Martin Jr. 10/21/2015 10:57 AM

Deleted: like

Lester Martin Jr. 10/21/2015 10:57 AM

Deleted: like

```
{ "ngram": ["Consent", "of", "the"], "estfrequency": 8.0 }
{ "ngram": ["shall", "be", "the"], "estfrequency": 7.0 }
{ "ngram": ["by", "the", "Congress"], "estfrequency": 7.0 }
```

Step 5: Compute a Contextual `ngram`

5.1. Let's find the 20 most frequent words that follow "the":

```
hive> select explode(context_ngrams(sentences(line),
    array("the",null),20)) as result
from constitution;
```

5.2. The result should look similar to:

```
{ "ngram": ["United"], "estfrequency": 76.0 }
{ "ngram": ["President"], "estfrequency": 30.0 }
{ "ngram": ["Congress"], "estfrequency": 22.0 }
{ "ngram": ["Senate"], "estfrequency": 21.0 }
{ "ngram": ["several"], "estfrequency": 15.0 }
{ "ngram": ["Vice"], "estfrequency": 12.0 }
{ "ngram": ["State"], "estfrequency": 11.0 }
{ "ngram": ["same"], "estfrequency": 10.0 }
{ "ngram": ["Constitution"], "estfrequency": 10.0 }
{ "ngram": ["States"], "estfrequency": 10.0 }
{ "ngram": ["House"], "estfrequency": 10.0 }
{ "ngram": ["whole"], "estfrequency": 10.0 }
{ "ngram": ["office"], "estfrequency": 9.0 }
{ "ngram": ["right"], "estfrequency": 8.0 }
{ "ngram": ["Legislature"], "estfrequency": 8.0 }
{ "ngram": ["Consent"], "estfrequency": 6.0 }
{ "ngram": ["powers"], "estfrequency": 6.0 }
{ "ngram": ["supreme"], "estfrequency": 6.0 }
{ "ngram": ["people"], "estfrequency": 6.0 }
{ "ngram": ["first"], "estfrequency": 6.0 }
```

Lab: Joining Datasets in Hive

This lab explores performing joins of two datasets in Hive.

Objective:	Perform a join of two datasets in Hive.
File locations:	/root/devph/labs/Lab7.4
Successful outcome:	A table named <code>stock_aggregates</code> that contains a join of NYSE stock prices with the stock's dividend prices.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Hive Programming

Perform the following steps:

Step 1: Load the Data into Hive

1.1. If not already done, open a Terminal in your VM and type "`ssh sandbox`".

1.2. View the contents of the file `setup.hive` in `/root/devph/labs/Lab7.4`:

```
# cd ~/devph/labs/Lab7.4/  
# more setup.hive
```

1.3. Notice that this script creates three tables in Hive. The `nyse_data` table is filled with the daily stock prices of stocks that start with the letter K and the `dividends` table that contains the quarterly dividends of those stocks. The `stock_aggregates` table is going to be used for a join of these two datasets and contain the stock price and dividend amount on the date the dividend was paid.

1.4. Run the `setup.hive` script from the Joining Datasets in Hive lab folder:

```
# hive -f setup.hive
```

1.5. To verify that the script worked, enter the Hive Shell and run the following following queries:

```
# hive  
hive> select * from nyse_data limit 20;  
hive> select * from dividends limit 20;
```

You should see daily stock prices and dividends from stocks that start with the letter K.

1.6. The `stock_aggregates` table should be empty, but view its schema to verify that it was created successfully, then type `quit` to exit the Hive Shell:

Lester Martin Jr. 11/3/2015 4:17 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:17 PM

Formatted: No bullets or numbering

Lester Martin Jr. 10/19/2015 11:21 PM

Deleted: 1

```
hive> describe stock_aggregates;
OK
symbol                string
year                  string
high                   float
low                    float
average_close          float
total_dividends        float

hive> quit;
```

Step 2: Join the Datasets

2.1. The join statement is going to be fairly long, so let's create it in a text file. Use `gedit` to create a new text in the `/root/devph/labs/Lab7.4/` folder named `join.hive`.

2.2. We will break the join statement down into sections. First, the result of the join is going to be put into the `stock_aggregates` table, which requires an insert:

```
insert overwrite table stock_aggregates
```

The overwrite causes any existing data in `stock_aggregates` to be deleted.

2.3. The data being inserted is going to be the result of a select query that contains various insightful indicators about each stock. The result is going to contain the stock symbol, date traded, maximum high for the stock, minimum low, average close, and the sum of dividends, as shown here:

```
select a.symbol, year(a.trade_date), max(a.high), min(a.low), avg(a.close),
sum(b.dividend)
```

2.4. The from clause is the `nyse_data` table:

```
from nyse_data a
```

2.5. The join is going to be a left outer join of the dividends table:

```
left outer join dividends b
```

2.6. The join is by stock symbol and trade date:

```
on (a.symbol = b.symbol and a.trade_date = b.trade_date)
```

2.7. Let's group the result by symbol and trade date:

```
group by a.symbol, year(a.trade_date);
```

2.8. Save your changes to `join.hive`.

Step 3: Run the Query

3.1. Run the query and wait for `Tez` to execute:

```
# hive -f join.hive
```

3.2. How many `total mappers and reducers` does it take to perform this query?

Answer: `Two mappers and one reducer`,

Copyright © 2015, Hortonworks, Inc. All rights reserved.

Lester Martin Jr. 11/11/2015 10:35 AM

Deleted: the MapReduce jobs

Lester Martin Jr. 11/11/2015 10:36 AM

Deleted: jobs

Lester Martin Jr. 11/11/2015 10:36 AM

Deleted: One MapReduce job with one mapper and one reducer

Step 4: Verify the Results

4.1. Enter the Hive Shell and run a select query to view the contents of `stock_aggregates`:

```
# hive
```

```
hive> select * from stock_aggregates;
```

The output should look like:

```
KYO 2004 90.9 66.25 75.79952 0.544
KYO 2005 78.45 62.58 72.042656 0.91999996
KYO 2006 98.01 71.73 85.80327 0.851
KYO 2007 110.01 81.0 93.737686 NULL
KYO 2008 100.78 45.41 79.6098 NULL
KYO 2009 93.2 52.98 77.04389 NULL
KYO 2010 93.83 85.94 90.71 NULL
stock_symbol NULL NULL NULL NULL NULL
```

4.2. List the contents of the `stock_aggregates` directory in HDFS. The `000000_0` file was created as a result of the join query:

```
hive> dfs -ls -R /apps/hive/warehouse/stock_aggregates/;
-rw-r--r-- 3 root hdfs 41109
/apps/hive/warehouse/stock_aggregates/000000_0
```

4.3. View the contents of the `stock_aggregates` table using the `cat` command:

```
hive> dfs -cat /apps/hive/warehouse/stock_aggregates/000000_0;
```

Result: The `stock_aggregates` table is a joining of the daily stock prices and the quarterly dividend amounts on the date the dividend was announced, and the data in the table is an aggregate of various statistics like max high, min low, etc.

Lab: Computing ngrams of Emails in Avro Format

This lab explores using Hive to compute ngrams.

Objective:	Use Hive to compute ngrams.
File locations:	/root/devph/labs/Lab7.5
Successful outcome:	A bigram of words found in a collection of Avro-formatted emails.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Hive Programming

Perform the following steps:

Step 1: View an Avro Schema

1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".

1.2. Change directories to the /root/devph/labs/Lab7.5 folder. Notice this folder contains an Avro file named sample.avro.

```
# cd ~/devph/labs/Lab7.5
```

```
# ls sample.avro
```

1.3. Enter the following command to view the schema of the contents of sample.avro:

```
# avro cat --print-schema sample.avro
```

1.4. How many fields do records in sample.avro have? _____

Answer: Four fields

1.5. Create a schema file for sample.avro:

```
# avro cat --print-schema sample.avro > sample.avsc
```

1.6. Put the schema file in HDFS:

```
# hdfs dfs -put sample.avsc
```

Step 2: Create a Hive Table from an Avro Schema

2.1. View the contents of the CREATE TABLE query defined in the create_sample_table.hive file in your Computing ngrams of Emails in Avro Format lab folder:

```
# more create_sample_table.hive
```

Lester Martin Jr. 11/3/2015 4:17 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:18 PM

Formatted: No bullets or numbering

Lester Martin Jr. 10/19/2015 11:27 PM

Deleted: 1

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

2.2. Make sure the `avro.schema.url` property points to the schema file you created in the previous step:

```
WITH SERDEPROPERTIES (  
  'avro.schema.url'='hdfs:///user/root/sample.avsc')
```

2.3. Run the `CREATE TABLE` query:

```
# hive -f create_sample_table.hive
```

Step 3: Verify the Table

3.1. Start the Hive shell.

```
# hive
```

3.2. Run the `show tables` command and verify that you have a table named `sample_table`.

```
hive> show tables;
```

3.3. Run the `describe` command on `sample_table`. Notice the schema for `sample_table` matches the Avro schema from `sample.avsc`.

```
hive> describe sample_table;
```

3.4. Let's associate some data with `sample_table`. Copy `sample.avro` into the Hive warehouse folder by running the following command (all on a single line):

```
hive> dfs -put /root/devph/labs/Lab7.5/sample.avro  
/apps/hive/warehouse/sample_table;
```

3.5. View the contents of `sample_table`, then quit the Hive Shell:

```
hive> select * from sample_table;  
OK  
Foo 19 10, Bar Eggs Spam 800  
hive> quit;
```

Note that there is only one record in `sample.avro`. You have now seen how to create a Hive table using an Avro schema file. This was a simple example; next you will complete these steps using a large data file that contains emails in an Avro format.

Step 4: Create an Email-User Table

4.1. There is an Avro file in your `/root/devph/labs/Lab7.5` folder named `mbox7.avro`, which represents emails in an Avro format from a Hive mailing list for the month of July. Use the `--print-schema` option of `avro` to view the schema of this file.

```
# avro cat --print-schema mbox7.avro
```

4.2. How many fields do records in `mbox7.avro` have? _____

Answer: Four fields

Lester Martin Jr. 11/3/2015 3:49 PM

Deleted: file

HDP Developer: Apache Pig and Hive

4.3. Run the `--print-schema` command again, but this time output the schema to a file named `mbox.avsc`:

```
# avro cat --print-schema mbox7.avro > mbox.avsc
```

4.4. Put the Avro schema file into `/user/root` in HDFS:

```
# hdfs dfs -put mbox.avsc
```

4.5. Use `more` to view the contents of the `create_email_table.hive` script in your `/root/devph/labs/Lab7.5` folder. Verify the `avro.schema.url` property is correct.

```
# more create_email_table.hive
```

4.6. Run the script to create the `hive_user_email` table:

```
# hive -f create_email_table.hive
```

4.7. Copy `mbox7.avro` into the warehouse directory:

```
# hdfs dfs -put mbox7.avro /apps/hive/warehouse/hive_user_email
```

4.8. Start the Hive shell and verify the table has data in it:

```
# hive
hive> select * from hive_user_email limit 20;
```

Step 5: Compute a Bigram

5.1. Use the Hive `ngrams` function to create a bigram of the words in `mbox7.avro`:

```
hive> select
  ngrams(sentences(content), 2, 10)
  from hive_user_email;
```

The output will be kind of a jumbled mess:

```
[{"ngram": ["2013", "at"], "estfrequency": 802.0}, {"ngram": ["of", "the"], "estfrequency": 391.0}, {"ngram": ["I", "am"], "estfrequency": 368.0}, {"ngram": ["I", "have"], "estfrequency": 340.0}, {"ngram": ["J", "E9r"], "estfrequency": 306.0}, {"ngram": ["f or", "the"], "estfrequency": 291.0}, {"ngram": ["you", "are"], "estfrequency": 289.0}, {"ngram": ["user", "hive.apache.org"], "estfrequency": 289.0}, {"ngram": ["to", "the"], "estfrequency": 276.0}, {"ngram": ["E9r", "F4me"], "estfrequency": 270.0}]
```

5.2. To clean this up, use the Hive `explode` function to display the output in a more readable format:

```
hive> select
  explode(ngrams(sentences(content), 2, 10))
  from hive_user_email;
```

You should see a nice, readable list of 10 bigrams:

```
{"ngram": ["2013", "at"], "estfrequency": 802.0}
{"ngram": ["of", "the"], "estfrequency": 391.0}
{"ngram": ["I", "am"], "estfrequency": 368.0}
{"ngram": ["I", "have"], "estfrequency": 340.0}
{"ngram": ["J", "E9r"], "estfrequency": 306.0}
```

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # `hadoop fs`

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # `hadoop fs`

```
{ "ngram": ["for", "the"], "estfrequency": 291.0 }
{ "ngram": ["you", "are"], "estfrequency": 289.0 }
{ "ngram": ["user", "hive.apache.org"], "estfrequency": 289.0 }
{ "ngram": ["to", "the"], "estfrequency": 276.0 }
{ "ngram": ["E9r", "F4me"], "estfrequency": 270.0 }
```

5.3. Typically when working with word comparison we ignore case. Run the query again, but this time add the Hive `lower` function and compute 20 bigrams:

```
hive> select
  explode(ngrams(sentences(lower(content)), 2, 20))
from hive_user_email;
```

The output should look like the following:

```
{ "ngram": ["2013", "at"], "estfrequency": 802.0 }
{ "ngram": ["i", "have"], "estfrequency": 409.0 }
{ "ngram": ["of", "the"], "estfrequency": 391.0 }
{ "ngram": ["i", "am"], "estfrequency": 372.0 }
{ "ngram": ["if", "you"], "estfrequency": 347.0 }
{ "ngram": ["in", "hive"], "estfrequency": 337.0 }
{ "ngram": ["for", "the"], "estfrequency": 309.0 }
{ "ngram": ["j", "e9r"], "estfrequency": 306.0 }
{ "ngram": ["you", "are"], "estfrequency": 289.0 }
{ "ngram": ["user", "hive.apache.org"], "estfrequency": 289.0 }
{ "ngram": ["to", "the"], "estfrequency": 276.0 }
{ "ngram": ["outer", "join"], "estfrequency": 271.0 }
{ "ngram": ["2013", "06"], "estfrequency": 270.0 }
{ "ngram": ["e9r", "f4me"], "estfrequency": 270.0 }
{ "ngram": ["left", "outer"], "estfrequency": 270.0 }
{ "ngram": ["in", "the"], "estfrequency": 252.0 }
{ "ngram": ["gmail.com", "wrote"], "estfrequency": 248.0 }
{ "ngram": ["17", "16"], "estfrequency": 248.0 }
{ "ngram": ["06", "17"], "estfrequency": 246.0 }
{ "ngram": ["wrote", "hi"], "estfrequency": 234.0 }
```

Step 6: Compute a Context `ngram`

6.1. From the Hive shell, run the following query, which uses the `context_ngrams` function to find the top 20 terms that follow the word “error”:

```
hive> select
  explode(context_ngrams(sentences(lower(content)),
    array("error", null), 20))
from hive_user_email;
```

The output should look like the following:

```
{ "ngram": ["in"], "estfrequency": 102.0 }
{ "ngram": ["return"], "estfrequency": 97.0 }
{ "ngram": ["org.apache.hadoop.hive ql.exec.udfargumenttypeexception"], "estfrequency": 49.0 }
{ "ngram": ["failed"], "estfrequency": 49.0 }
{ "ngram": ["is"], "estfrequency": 41.0 }
{ "ngram": ["message"], "estfrequency": 40.0 }
```

Lester Martin Jr. 11/11/2015 10:44 AM

Deleted: <#>Run the same query again, but this time run it on Tez: ... [33]

```
{ "ngram": ["when"], "estfrequency": 39.0 }
{ "ngram": ["please"], "estfrequency": 36.0 }
{ "ngram": ["while"], "estfrequency": 28.0 }
{ "ngram": ["org.apache.thrift.transport.ttransportexception"], "estfrequency": 28.0 }
{ "ngram": ["datanucleus.plugin"], "estfrequency": 26.0 }
{ "ngram": ["during"], "estfrequency": 18.0 }
{ "ngram": ["query"], "estfrequency": 16.0 }
{ "ngram": ["hive"], "estfrequency": 16.0 }
{ "ngram": ["could"], "estfrequency": 16.0 }
{ "ngram": ["java.lang.runtimeexception"], "estfrequency": 13.0 }
{ "ngram": ["13"], "estfrequency": 12.0 }
{ "ngram": ["error"], "estfrequency": 12.0 }
{ "ngram": ["exec.execdriver"], "estfrequency": 10.0 }
{ "ngram": ["exec.task"], "estfrequency": 10.0 }
```

6.2. What is the most likely word to follow “error” in these emails? _____

Answer: “in”

6.3. Run a Hive query that finds the top 20 results for words in mbox7.avro that follow the phrase “error in.”

Solution:

```
select
  explode(context_ngrams(sentences(lower(content)),
    array("error", "in", null), 20))
from hive_user_email;
```

Result: You have written several Hive queries that computed bigrams based on the data in the `mbox7.avro` file. You should also be familiar with working with Avro files, a popular file format in Hadoop.

Lab: Using HCatalog with Pig

This lab explores using HCatalog to provide the schema for a Pig relation.

Objective:	Use HCatalog to provide the schema for a Pig relation.
File locations:	n/a
Successful outcome:	You will have written a Pig script that uses HCatLoader to retrieve a schema from an HCatalog table and HCatStorer to write data to a table managed by HCatalog.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM. Complete the Understanding Hive Tables Lab.
Related lesson:	Using HCatalog

Lester Martin Jr. 10/19/2015 11:45 PM

Deleted: 1

Perform the following steps:

Step 1: Start the Grunt Shell

1.1. If not already done, open a Terminal in your VM and type "[ssh sandbox](#)".

1.2. Start the Grunt shell for use with HCatalog:

```
# pig -useHCatalog
```

Step 2: Load an HCatalog Table

2.1. Define a relation for the `wh_visits` table in Hive using the `HCatLoader()`:

```
grunt> visits = LOAD 'wh_visits' USING  
org.apache.hive.hcatalog.pig.HCatLoader();
```

2.2. View the schema of the `visits` relation to verify that it matches the schema of the `wh_visits` table:

```
grunt> describe visits;  
  
visits: {lname: chararray, fname: chararray, time_of_arrival:  
chararray, appt_scheduled_time: chararray, meeting_location:  
chararray, info_comment: chararray}
```

Step 3: Run a Pig Query

3.1. Let's execute a query to verify that everything is working. Define the following relation:

```
grunt> joe = FILTER visits BY (fname == 'JOE');
```

3.2. Dump the relation:

```
grunt> DUMP joe;
```

The output should be visitors from `wh_visits` with the first name "JOE."

Step 4: Create an HCatalog Schema

4.1. Quit the Grunt shell and start the Hive shell.

```
grunt> quit;
```

```
# hive
```

4.2. An HCatalog schema is essentially just a table in the Hive metastore. To define a schema for use with HCatalog, create a table in Hive:

```
hive> create table joes (fname string, lname string, comments string);
```

4.3. Verify that the table was created successfully using 'show tables.'

```
hive> show tables;
```

4.4. Use the `describe` command to view the schema of `joes`:

```
hive> describe joes;
```

```
OK
fname          string
lname          string
comments       string
```

Step 5: Using HCatStorer

5.1. Exit the Hive shell and start the Grunt shell again. Be sure to use the `useHCatalog` option:

```
hive> quit;
```

```
# pig -useHCatalog
```

5.2. Define the visits and joe relations again (using the up arrow to browse through the history of Pig commands).

5.3. In this step, you will use HCatStorer in Pig to input records into the `joes` table. To do this, you need a relation whose fields match the schema of `joes`. You can accomplish this using a projection. Define the following relation:

```
grunt> project_joe = FOREACH joe GENERATE fname, lname, info_comment;
```

5.4. Store the projection into the HCatalog table using the `STORE` command:

```
grunt> STORE project_joe INTO 'joes' USING
org.apache.hive.hcatalog.pig.HCatStorer();
```

This command failed. Why? _____

Answer: The initial `STORE` command failed because the field names in the relation you were trying to store did not match the column names of the underlying table's schema.

5.5. Notice that the projection has fields named `fname`, `lname`, and `info_comment`, but the `joes` table in HCatalog has a schema with `fname`, `lname`, and `comments`. The `fname` and `lname` fields match, but `info_comment` needs to be renamed to `comments`. Modify your projection by using the `AS` keyword:

```
grunt> project_joe = FOREACH joe GENERATE fname, lname, info_comment AS
comments;
```

5.6. Now run the `STORE` command again:

```
grunt> STORE project_joe INTO 'joes' USING
org.apache.hive.hcatalog.pig.HCatStorer();
```

This time the command should work and a MapReduce job will execute.

Step 6: Verify that the `STORE` Worked

6.1. Quit the Grunt shell and start the Hive shell again.

```
grunt> quit;
```

```
# hive
```

6.2. View the contents of the `joes` table:

```
hive> select * from joes;
```

You should see visitors all named “JOE,” along with their last name and the comments.

Step 7: View the Files

7.1. You can also check the file system to see if a `STORE` command worked:

```
hive> dfs -ls /apps/hive/warehouse/joes/;
Found 1 items
-rw-r--r-- 1 root hdfs      896 /apps/hive/warehouse/joes/part-m-00000
```

Notice that the file for the `joes` table is named `part-m-00000`. Where did that name come from? _____

Answer: The `part-m-00000` file is a result of the Pig MapReduce job that executed when you ran the `STORE` command with `HCatStorer`.

7.2. Use the `cat` command to view the contents of `part-m-00000`:

```
hive> dfs -cat /apps/hive/warehouse/joes/part-m-00000;
```

As you can see, this is the same list of names from the Hive `select *` query, which should be no surprise at this point in the course.

Result: You have seen how to run a Pig script that uses HCatalog to provide the schema using `HCatLoader` and `HCatStorer`.

Lab: Advanced Hive Programming

This lab explores some of the more advanced features of Hive work, including multi-table inserts, views, and windowing.

Objective:	To understand how some of the more advanced features of Hive work, including multi-table inserts, views, and windowing.
File locations:	/root/devph/labs/Lab9.1
Successful outcome:	You will have executed numerous Hive queries on customer order data.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Advanced Hive Programming

Perform the following steps:

Step 1: Create and Populate a Hive Table

1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".

1.2. From the command line, change directories to /root/devph/labs/Lab9.1 folder:

```
# cd ~/devph/labs/Lab9.1
```

1.3. View the contents of the orders.hive file in that folder:

```
# more orders.hive
```

Notice it defines a Hive table named orders that has seven columns.

1.4. Execute the contents of orders.hive:

```
# hive -f orders.hive
```

1.5. From the Hive shell, verify that the script worked by running the following commands:

```
# hive
```

```
hive> describe orders;
```

```
hive> select count(*) from orders;
```

Your orders table should contain 99,999 records.

Step 2: Analyze the Customer Data

2.1. Let's run a few queries to see what this data looks like. Start by verifying that the username column actually looks like names:

Lester Martin Jr. 11/3/2015 4:18 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:18 PM

Formatted: No bullets or numbering

Lester Martin Jr. 10/19/2015 11:53 PM

Deleted: 2

Lester Martin Jr. 11/11/2015 10:57 AM

Deleted: hive> set

hive.execution.engine=tez; .

```
hive> SELECT username FROM orders LIMIT 10;
```

You should see 10 first names.

2.2. The orders table contains orders placed by customers. Run the following query, that shows the 10 lowest-price orders:

```
hive> SELECT username, ordertotal FROM orders ORDER BY ordertotal LIMIT 10;
```

The smallest orders are each \$10, as you can see from the output:

```
Chelsea      10
Samantha     10
Danielle     10
Kimberly     10
Tiffany      10
Megan        10
Maria        10
Megan        10
Melissa      10
Christina    10
```

2.3. Run the same query, but this time use descending order:

```
hive> SELECT username, ordertotal FROM orders ORDER BY ordertotal DESC LIMIT 10;
```

The output this time is the 10 highest-priced orders:

```
Brandon      612
Mark         612
Sean         612
Jordan              612
Anthony      612
Paul         611
Jonathan     611
Eric         611
Nathan              611
Jordan              610
```

2.4. Let's find out if men or women spent more money:

```
hive> SELECT sum(ordertotal), gender FROM orders GROUP BY gender;
```

Based on the output, which gender has spent more money on purchases? _____

Answer: Men spent \$9,919,847, and women spent \$9,787,324.

2.5. The `orderdate` column is a string with the format `yyyy-mm-dd`. Use the `year` function to extract the various parts of the date. For example, run the following query, which computes the sum of all orders for each year:

```
hive> SELECT sum(ordertotal), year(order_date) FROM orders GROUP BY year(order_date);
```

The output should look like this. **Verify, then quit the Hive shell:**

```
4082780      2009
```

HDP Developer: Apache Pig and Hive

```
4404806    2010
4399886    2011
4248950    2012
2570749    2013
```

```
hive> quit;
```

Step 3: Multi-File Insert

3.1. In this step, you will run two completely different queries, but in a single job. The output of the queries will be in two separate directories in HDFS. Start by using `gedit` to create a new text file in the `/root/devph/labs/Lab9.1` folder named `multifile.hive`.

3.2. Within the text file, enter the following query. Notice there is no semicolon between the two `INSERT` statements:

```
FROM ORDERS o
INSERT OVERWRITE DIRECTORY '2010_orders'
SELECT o.* WHERE year(order_date) = 2010
INSERT OVERWRITE DIRECTORY 'software'
SELECT o.* WHERE itemlist LIKE '%Software%';
```

3.3. Save your changes to `multifile.hive`.

3.4. Run the query from the command line:

```
# hive -f multifile.hive
```

3.5. The above query executes in a single job. Even more interesting, it only requires a `map` phase.

Why did this job not require a `reduce` phase?

Answer: Because the query only does a `SELECT *`, no `reduce` phase was needed.

3.6. Verify that the two queries executed successfully by viewing the folders in HDFS:

```
# hdfs dfs -ls
```

You should see two new folders: `2010_orders` and `software`.

3.7. View the output files in these two folders. Verify that the `2010_orders` directory contains orders from only the year 2010, and verify that the `software` directory contains only orders that included `'Software.'`

```
# hdfs dfs -ls 2010_orders
```

```
# hdfs dfs -cat 2010_orders/000000_0
```

```
# hdfs dfs -ls software
```

```
# hdfs dfs -cat software/000000_0
```

Step 4: Define a View

Lester Martin Jr. 11/11/2015 11:00 AM

Deleted: MapReduce

Lester Martin Jr. 11/11/2015 11:00 AM

Deleted: MapReduce

Lester Martin Jr. 10/28/2015 5:04 PM

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

Lester Martin Jr. 10/28/2015 5:04 PM

Deleted: # hadoop fs

4.1. Start the Hive shell. Define a view named `2013_orders` that contains the `orderid`, `order_date`, `username`, and `itemlist` columns of the `orders` table where the `order_date` was in the year 2013.

Solution: The `2013_orders` view:

```
# hive
hive> CREATE VIEW 2013_orders AS
SELECT orderid, order_date, username, itemlist
FROM orders
WHERE year(order_date) = '2013';
```

4.2. Run the `show tables` command:

```
hive> show tables;
```

You should see `2013_orders` in the list of tables.

4.3. To verify your view is defined correctly, run the following query:

```
hive> SELECT COUNT(*) FROM 2013_orders;
```

The `2013_orders` view should contain 13,104 records.

Step 5: Find the Maximum Order of Each Customer

5.1. Suppose you want to find the maximum order of each customer. This can be done easily enough with the following Hive query. Run this query now:

```
hive> SELECT max(ordertotal), userid
FROM orders GROUP BY userid;
```

5.2. How many different customers are in the `orders` table? _____

Answer: There are 100 unique customers in the `orders` table.

5.3. Suppose you want to add the `itemlist` column to the previous query. Try adding it to the `SELECT` clause by the following method and see what happens:

```
hive> SELECT max(ordertotal), userid, itemlist
FROM orders GROUP BY userid;
```

Notice this query is not valid because `itemlist` is not in the `GROUP BY` key.

5.4. We can join the result set of the `max-total` query with the `orders` table to add the `itemlist` to our result. Start by defining a view named `max_ordertotal` for the maximum order of each customer:

```
hive> CREATE VIEW max_ordertotal AS
SELECT max(ordertotal) AS maxtotal, userid
FROM orders GROUP BY userid;
```

5.5. Now join the `orders` table with your `max_ordertotal` view:

```
hive> SELECT ordertotal, orders.userid, itemlist
FROM orders
JOIN max_ordertotal ON
```

Lester Martin Jr. 11/11/2015 11:03 AM

Deleted: hive> set
hive.execution.engine=tez; .

```
max_ordertotal.userid = orders.userid
AND
max_ordertotal.maxtotal = orders.ordertotal
ORDER BY orders.userid;
```

5.6. What did the Tez job look like for this query? _____

Answer: The query resulted in a map-reduce-reduce Tez job.

5.7. The end of your output should look like:

```
600 98
Grill,Freezer,Bedding,Headphones,DVD,Table,Grill,Software,Dishwasher,DVD,Micr
rowave,Adapter
600 99 Washer,Cookware,Vacuum,Freezer,2-Way Radio,Bicycle,Washer &
Dryer,Coffee Maker,Refrigerator,DVD,Boots,DVD
600 100 Bicycle,Washer,DVD,Wrench Set,Sweater,2-Way
Radio,Pants,Freezer,Blankets,Grill,Adapter,pillows
```

Step 6: Fixing the GROUP BY Key Error

6.1. Let's compute the sum of all of the orders of all of the customers. Start by entering the following query:

```
hive> SELECT sum(ordertotal), userid FROM orders GROUP BY userid;
```

Notice that the output is the sum of all orders, but displaying just the `userid` is not very exciting.

6.2. Try to add the `username` column to the `SELECT` clause in the following manner and see what happens:

```
hive> SELECT sum(ordertotal), userid, username
FROM orders
GROUP BY userid;
```

This generates the infamous "Expression not in GROUP BY key" error, because the `username` column is not being aggregated but the `ordertotal` is.

6.3. An easy fix is to aggregate the username values using the `collect_set` function, but output only one of them:

```
hive> SELECT sum(ordertotal), userid, collect_set(username)[0] FROM orders
GROUP BY userid;
```

You should get the same output as before, but this time the `username` is included.

Step 7: Using the OVER Clause

7.1. Now let's compute the sum of all orders for each customer, but this time use the `OVER` clause to not group the output and to also display the `itemlist` column:

```
hive> SELECT userid, itemlist, sum(ordertotal)
OVER (PARTITION BY userid)
FROM orders;
```

Notice the output contains every order, along with the items they purchased and the sum of all of the orders ever placed from that particular customer.

Step 8: Using the Window Functions

8.1. It is not difficult to compute the sum of all orders for each day using the `GROUP BY` clause:

```
hive> select order_date, sum(ordertotal)
FROM orders
GROUP BY order_date;
```

Run the query above and the tail of the output should look like:

```
2013-07-28 18362
2013-07-29 3233
2013-07-30 4468
2013-07-31 4714
```

8.2. Suppose you want to compute the sum for each day that includes each order. This can be done using a window that sums all previous orders along with the current row:

```
hive> SELECT order_date, sum(ordertotal)
OVER
(PARTITION BY order_date ROWS BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW)
FROM orders;
```

To verify that it worked, your tail of your output should look like:

```
2013-07-31 3163
2013-07-31 3415
2013-07-31 3607
2013-07-31 4146
2013-07-31 4470
2013-07-31 4610
2013-07-31 4714
```

Step 9: Using the Hive Analytics Functions

9.1. Run the following query, which displays the rank of the `ordertotal` by day:

```
hive> SELECT order_date, ordertotal, rank()
OVER
(PARTITION BY order_date ORDER BY ordertotal)
FROM orders;
```

9.2. To verify it worked, the output of July 31, 2013, should look like:

```
2013-07-31 48 1
2013-07-31 104 2
2013-07-31 119 3
2013-07-31 130 4
2013-07-31 133 5
2013-07-31 135 6
2013-07-31 140 7
2013-07-31 147 8
2013-07-31 156 9
```

```
2013-07-31 192 10
2013-07-31 192 10
2013-07-31 196 12
2013-07-31 240 13
2013-07-31 252 14
2013-07-31 296 15
2013-07-31 324 16
2013-07-31 343 17
2013-07-31 500 18
2013-07-31 528 19
2013-07-31 539 20
```

9.3. As a challenge, see if you can run a query similar to the previous one except compute the rank over months instead of each day.

Solution: The rank query by month:

```
SELECT substr(order_date,0,7), ordertotal, rank()
OVER
(PARTITION BY substr(order_date,0,7) ORDER BY ordertotal)
FROM orders;
```

Step 10: Histograms

10.1. Run the following Hive query, which uses the `histogram_numeric` function to compute 20 (x,y) pairs of the frequency distribution of the total order amount from customers who purchased a microwave (using the orders table):

```
hive> SELECT explode(histogram_numeric(ordertotal,20)) AS x
FROM orders
WHERE itemlist LIKE "%Microwave%";
```

The output should look like the following:

```
{"x":14.333333333333332,"y":3.0}
{"x":33.87755102040816,"y":441.0}
{"x":62.52577319587637,"y":679.0}
{"x":89.37823834196874,"y":965.0}
{"x":115.1242236024843,"y":1127.0}
{"x":142.6468885672939,"y":1382.0}
{"x":174.07664233576656,"y":1370.0}
{"x":208.06909090909105,"y":1375.0}
{"x":242.55486381322928,"y":1285.0}
{"x":275.8625954198475,"y":1048.0}
{"x":304.71100917431284,"y":872.0}
{"x":333.1514423076924,"y":832.0}
{"x":363.7630208333335,"y":768.0}
{"x":397.51587301587364,"y":756.0}
{"x":430.9072847682117,"y":604.0}
{"x":461.68715083798895,"y":537.0}
{"x":494.1598360655734,"y":488.0}
{"x":528.5816326530613,"y":294.0}
{"x":555.5166666666672,"y":180.0}
{"x":588.7979797979801,"y":198.0}
```

10.2. Write a similar Hive query that computes 10 frequency-distribution pairs for the `ordertotal` from the `orders` table where `ordertotal` is greater than \$200.

```
SELECT explode(histogram_numeric(ordertotal,10)) AS x
FROM orders
WHERE ordertotal > 200;
```

```
{ "x": 218.8195174551819, "y": 7419.0 }
{ "x": 254.10237580993478, "y": 6945.0 }
{ "x": 293.4231618807192, "y": 6338.0 }
{ "x": 334.57302573203015, "y": 5635.0 }
{ "x": 379.79714934930786, "y": 4841.0 }
{ "x": 428.1165628891644, "y": 4015.0 }
{ "x": 473.1484734420741, "y": 2391.0 }
{ "x": 511.2576946288467, "y": 1657.0 }
{ "x": 549.0106899902812, "y": 1029.0 }
{ "x": 589.0761194029857, "y": 670.0 }
```

Result: You should now be comfortable running Hive queries and using some of the more advanced features of Hive, like views and the window functions.

Demonstration: Hive Optimizations

Lester Martin Jr. 11/11/2015 1:22 PM

Comment [2]: Removing ENTIRE demonstration as it just isn't as clear on this very tiny cluster with small data

Lab: Running a YARN Application

This lab explores how to run a YARN application.

Objective:	To run a YARN application.
File locations:	n/a
Successful outcome:	You will have executed the DistributedShell YARN application.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Hadoop 2 and YARN

Perform the following steps:

Step 1: Run a DistributedShell Application

1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".

1.2. In a terminal window, change directories to the /usr/hdp/current/hadoop-yarn-client folder:

```
# cd /usr/hdp/current/hadoop-yarn-client/
```

1.3. Run the following command, which runs a sample YARN application that ships with HDP 2.x:

```
# yarn jar hadoop-yarn-applications-distributedshell.jar
org.apache.hadoop.yarn.applications.distributedshell.Client -jar hadoop-yarn-applications-distributedshell.jar -shell_command cal
```

The DistributedShell command allows you to run a script or shell command on your cluster. The example above runs the Unix "cal" command, which displays a text calendar.

1.4. Wait for the YARN job to finish.

Step 2: Verify the Result

2.1. Enter the following command (all on a single line):

```
# yarn application -list -appStates FINISHED | grep Dist
```

You should see the application ID of the DistributedShell command that you just ran:

```
application_1378331467073_0004 DistributedShell YARN yarn
default FINISHED SUCCEEDED 100%
```

Lester Martin Jr. 11/3/2015 4:18 PM

Deleted: About this Lab

Lester Martin Jr. 11/3/2015 4:18 PM

Formatted: No bullets or numbering

Lester Martin Jr. 10/20/2015 9:34 AM

Deleted: 2.2.0.0-2041

2.2. Copy and paste the application ID of your `DistributedShell` command and check its status using the following command (but replacing the ID shown here with your actual application ID):

```
# yarn application -status application_1378331467073_0004
```

Notice that the details of the job are displayed. This was a simple application, so there is not a lot of information to analyze:

```
Application Report :
  Application-Id : application_1378331467073_0004
  Application-Name : DistributedShell
  Application-Type : YARN
  User : root
  Queue : default
  Start-Time : 1408060384688
  Finish-Time : 1408060391340
  Progress : 100%
  State : FINISHED
  Final-State : SUCCEEDED
  Tracking-URL : N/A
  RPC Port : -1
  AM Host : sandbox.hortonworks.com/172.16.173.149
  Diagnostics :
```

NOTE: The YARN application command also has a `-kill` option (followed by the application's ID) that kills a running `YARN` job. This is a great tool when you have submitted a job and then need to stop it before it runs to completion.

Step 3: View the Log File

3.1. Enter the following command to view the output for this `YARN` application that you just executed:

```
# yarn logs -applicationId application_1378331467073_0004
```

IMPORTANT: The `-applicationId` must have the correct case for every letter, or else you will see an error message stating that it is missing. The only capital letter in the option is the `I`. The `d`, and all other letters, are lower case.

Somewhere in the log file, you should see a text calendar of the current month. For example:

```
LogType: stdout
LogLength: 150
Log Contents:
  August 2014
Su Mo Tu We Th Fr Sa
      1  2
 3  4  5  6  7  8  9
```

HDP Developer: Apache Pig and Hive

```
10 11 12 13 14 15 16
17 18 19 20 21 22 23
24 25 26 27 28 29 30
31
```

Step 4: Optional: Run the Job in [Six](#) Containers

4.1. The DistributedShell application allows you to specify how many containers the ApplicationMaster uses. Add the following arguments to the end of the `YARN` command from Step 1.2:

```
-num_containers 6 -container_memory 20
```

4.2. Now find the `applicationID` and view the aggregated log file:

```
# yarn application -list -appStates FINISHED | grep Dist
```

```
# yarn logs -applicationId <applicationId>
```

You should see six calendars this time, one from each container.

4.3. Notice that this also demonstrates how the log output from multiple containers is aggregated into a single, convenient log file.

Result: In this lab you ran a simple YARN application called the DistributedShell (that ships with HDP 2.x). You also saw how to view the output of the aggregated log file using the YARN logs command.

Lab: Defining an Oozie Workflow

This lab explores how to define and run an Oozie workflow.

Objective:	Define and run an Oozie workflow.
File locations:	/root/devph/labs/Oozie
Successful outcome:	You will run an Oozie job that executes a Pig script and a Hive script.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Defining Workflow with Oozie

Perform the following steps:

Step 1: Store the Job Data in HDFS

- 1.1. If not already done, open a Terminal in your VM and type "ssh sandbox".
- 1.2. Make sure you have whitehouse/visits.txt in HDFS:

```
# hdfs dfs -ls whitehouse
```

If not, the file (zipped within whitehouse visits.zip) can be found in the /root/devph/labs/Lab5.1 folder. The Oozie job assumes there is a file named visits.txt in a folder named whitehouse in HDFS.

Step 2: Deploy the Oozie Workflow

- 2.1. Using the gedit text editor, open the file /root/devph/labs/Oozie/workflow.xml.
- 2.2. How many actions are in this workflow? _____
Answer: Two
- 2.3. Which action will execute first? _____
Answer: The Pig action named export_congress
- 2.4. If the first action is successful, which action will execute next? _____
Answer: The Hive action named define_congress_table
- 2.5. To deploy this workflow, we need a directory in HDFS:

```
# cd ~/devph/labs/Oozie/  
# hdfs dfs -mkdir congress
```

- 2.6. Copy congress_visits.hive and whitehouse.pig from the Oozie folder into the new congress folder in HDFS.

Copyright © 2015, Hortonworks, Inc. All rights reserved.

Lester Martin Jr. 10/20/2015 9:48 AM

Deleted: Pull

HDP Developer: Apache Pig and Hive

```
# hdfs dfs -put congress_visits.hive congress/congress_visits.hive
# hdfs dfs -put whitehouse.pig congress/whitehouse.pig
```

2.7. Also, put `workflow.xml` into the congress folder.

```
# hdfs dfs -put workflow.xml congress/workflow.xml
```

2.8. Verify that you have three files now in your congress folder in HDFS:

```
# hdfs dfs -ls congress
Found 3 items
-rw-r--r-- 1 root root 429 congress/congress_visits.hive
-rw-r--r-- 1 root root 580 congress/whitehouse.pig
-rw-r--r-- 1 root root 1692 congress/workflow.xml
```

Step 3: Deploy the Hive Configuration File

3.1. If you look at the Hive action in `workflow.xml`, you will notice that it references a file named `hive-site.xml` within the `<job-xml>` tag. This file represents the settings Oozie needs to connect to your Hive instance, and the file needs to be deployed in HDFS (using a relative path to the workflow directory). Make a copy of the original file into the working directory:

```
# cp /etc/hive/conf/hive-site.xml .
```

3.1. To address an Oozie expression language issue and to ensure the workflow will run in the lab VM, use the `gedit` text editor to open `/root/devph/labs/Oozie/hive-site.xml` and delete the marked-out stanza below as well as change the default execution engine from `tez` to `mr`:

```
<property>
  <name>hive.server2.logging.operation.log.location</name>
  <value>${system:java.io.tmpdir}/${system:user.name}/operation_logs</value>
</property>
<property>
  <name>hive.execution.engine</name>
  <value>mr</value>
</property>
```

3.1. Verify that the differences from the original file and the modified one are correct by returning results similar to those listed below:

```
# diff /etc/hive/conf/hive-site.xml hive-site.xml
250c250
< <value>tez</value>
---
> <value>mr</value>
544,548d543
< <name>hive.server2.logging.operation.log.location</name>
<
<value>${system:java.io.tmpdir}/${system:user.name}/operation_logs</value>
< </property>
<
```

Formatted: Highlight

```
< <property>
783c778
< </configuration>
\ No newline at end of file
---
> </configuration>
```

3.2. Copy the modified `hive-site.xml` into the workflow directory:

```
# hdfs dfs -put hive-site.xml congress/hive-site.xml
```

Step 4: Define the `OOZIE_URL` Environment Variable

4.1. Although not required, you can simplify `oozie` commands by defining the `OOZIE_URL` environment variable. From the command line, enter the following command:

```
# export OOZIE_URL=http://sandbox:11000/oozie
```

Step 5: Run the Workflow

Run the workflow with the following command from the `/root/devph/labs/Oozie` directory:

```
# oozie job -config job.properties -run
```

The `job.properties` file reference above contains the following entries (no need to type this):

```
oozie.wf.application.path=hdfs://sandbox:8020/user/root/congress
#Hadoop RM
resourceManager=resourcemanager:8050
#Hadoop fs.default.name
nameNode=hdfs://sandbox:8020/
#Hadoop mapred.queue.name
queueName=default
oozie.use.system.libpath=true
```

If successful, the job ID should be displayed at the command prompt.

Step 6: Monitor the Workflow

6.1. Point your Web browser to the Oozie Web Console at the following URL:
`http://sandbox:11000/oozie`

You should see your Oozie job in the list of workflow jobs:

Lester Martin Jr. 11/10/2015 1:19 PM

Deleted: If you look at the Hive action in `workflow.xml`, you will notice that it references a file named `hive-site.xml` within the `<job-xml>` tag. Formatted: Program Listing

Lester Martin Jr. 10/21/2015 10:50 AM

Deleted: # `oozie job -config job.properties -run` ... [36]

6.2. Click on the Job ID to the Job Info page:

Lester Martin Jr. 10/20/2015 9:52 AM

Deleted: Double-c

6.3. Notice that you can view the status of each Action within the workflow.

Step 7: Verify the Results

HDP Developer: Apache Pig and Hive

7.1. The Oozie job should take **a few** minutes to complete. Refresh the status page every so often until the status changes from RUNNING to COMPLETE, or the job no longer appears under Active Jobs tab and shows up under the Done Jobs tab.

Once the Oozie job is completed successfully, back in the terminal window start the Hive Shell.

```
# hive
```

7.2. Run a select statement on `congress_visits` and verify that the table is populated:

```
hive> select * from congress_visits;
...
WATERS      MAXINE      12/8/2010 17:00  POTUS      OEOB
MEMBERS OF CONGRESS AND CONGRESSIONAL STAFF
WATT MEL    12/8/2010 17:00  POTUS      OEOB MEMBERS OF
CONGRESS AND CONGRESSIONAL STAFF
WEGNER      DAVID L     12/8/2010 16:46  12/8/2010 17:00  POTUS      OEOB
MEMBERS OF CONGRESS AND CONGRESSIONAL STAFF
WILLOUGHBY JEANNE      P    12/8/2010 17:07  12/8/2010 17:00  POTUS
OEOB MEMBERS OF CONGRESS AND CONGRESSIONAL STAFF
WILSON      ROLLIE      E    12/8/2010 16:49  12/8/2010 17:00  POTUS
OEOB MEMBERS OF CONGRESS AND CONGRESSIONAL STAFF
YOUNG DON   12/8/2010 17:00  POTUS      OEOB MEMBERS OF
CONGRESS AND CONGRESSIONAL STAFF
MCCONNELL  MITCH       12/14/2010 9:00  POTUS      WH  MEMBER OF
CONGRESS MEETING WITH POTUS.
Time taken: 1.082 seconds, Fetched: 102 row(s)
```

Result: You have just executed an Oozie workflow that consists of a Pig script followed by a Hive script.

Lab: Getting Started with Apache Spark

This lab explores Spark Core and RDD structures using Python Spark Shell.

Objective:	Read and manipulate HDFS files with Spark.
File locations:	/root/devph/labs/Spark
Successful outcome:	You will have processed several HDFS file via Spark Core.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Programming with Apache Spark

Perform the following steps:

Step 8: Execute a WordCount with Spark.

8.1. If not already done, open a Terminal in your VM and type "ssh sandbox".

8.2. Copy the constitution.txt file to HDFS.

```
[root@sandbox ~]# cd ~/devph/labs/Spark
[root@sandbox Spark]# hdfs dfs -mkdir spark
[root@sandbox Spark]# hdfs dfs -put ~/devph/labs/demos/constitution.txt
spark/
[root@sandbox Spark]# hdfs dfs -ls spark
Found 1 items
-rw-r--r-- 1 root hdfs 45489 2015-11-09 09:39 spark/constitution.txt
```

8.3. Launch the Python Spark Shell. NOTE: "INFO" comments will be removed from the output in this lab guide going forward.

```
[root@sandbox ~]# pyspark
Python 2.6.6 (r266:84292, Jul 23 2015, 15:22:56)
[GCC 4.4.7 20120313 (Red Hat 4.4.7-11)] on linux2

... lines removed ...

Welcome to

  / / / / /
 / \ / \ / \ / \ / \
 / / . \ / / / / \ \ version 1.4.1
 / /

Using Python version 2.6.6 (r266:84292, Jul 23 2015 15:22:56)
SparkContext available as sc, HiveContext available as sqlContext.
>>>
```

Lester Martin Jr. 11/9/2015 7:15 PM

Formatted: No bullets or numbering

8.4. Read in the file as a RDD.

```
>>> baseFile =
sc.textFile("hdfs://sandbox:8020/user/root/spark/constitution.txt")
>>> baseFile.take(1)
[u'We the People of the United States, in Order to form a more perfect ']
```

8.5. Break the full lines down into a collection of words.

```
>>> justWords = baseFile.flatMap(lambda line: line.split(' '))
>>> justWords.take(5)
[u'Ve', u'the', u'People', u'of', u'the']
```

8.6. Map the words with a count of "1" for each.

```
>>> mappedWords = justWords.map(lambda word: (word, 1))
>>> mappedWords.take(5)
[(u'Ve', 1), (u'the', 1), (u'People', 1), (u'of', 1), (u'the', 1)]
```

8.7. Count up the words; sorting them in reverse.

```
>>> wordCounts = mappedWords.reduceByKey(lambda a,b:
a+b).sortByKey(ascending=False)
>>> wordCounts.take(10)
[(u'years;', 1), (u'years', 9), (u'year,', 1), (u'year', 1), (u'written', 6),
(u'writs', 1), (u'writing,', 1), (u'would', 2), (u'work', 1), (u'witnesses',
2)]
```

8.8. Chain all the method invocations into a single operation, as is more the normal usage pattern. NOTE: Type as a single line without the new line or "\n" characters.

```
>>> asOneLine =
sc.textFile("hdfs://sandbox:8020/user/root/spark/constitution.txt") \
    .flatMap(lambda line: line.split(' ')) \
    .map(lambda word: (word, 1)) \
    .reduceByKey(lambda a,b: a+b) \
    .sortByKey(ascending=False)
>>> asOneLine.take(10)
[(u'years;', 1), (u'years', 9), (u'year,', 1), (u'year', 1), (u'written', 6),
(u'writs', 1), (u'writing,', 1), (u'would', 2), (u'work', 1), (u'witnesses',
2)]
```

8.9. Exit out of the pyspark REPL.

```
>>> quit()
```

Step 9: On a simple customer file, find the top 5 states with the most male customers.

9.1. Upload customer.csv and explore its format of name, gender, state and duration.

```
[root@sandbox Spark]# hdfs dfs -put customer.csv spark
[root@sandbox Spark]# hdfs dfs -tail spark/customer.csv
celia,F,Maryland,3.97
Evalyn,F,Pennsylvania,2.1
Jeneva,F,Nebraska,9.26
Kelsey,F,Minnesota,8.68
Daine,F,Nebraska,6.34
```

```
... lines removed ...
```

```
Annamae,F,Nebraska,9.11  
Racheal,F,Wisconsin,9.65  
Ellan,F,Michigan,5.82
```

9.2. Launch pyspark and read the file.

```
[root@sandbox labs]# pyspark  
>>> custFile =  
sc.textFile("hdfs://sandbox:8020/user/root/spark/customer.csv")  
>>> custFile.take(3)  
[u'Irvin,M,Maryland,5.06', u'Owen,M,Illinois,2.01',  
u'August,M,Illinois,1.42']
```

9.3. Filter out just the male customers.

```
>>> justMales = custFile.map(lambda line: line.split(',')).filter(lambda  
line: line[1] == 'M')  
>>> justMales.take(2)  
[[u'Irvin', u'M', u'Maryland', u'5.06'], [u'Owen', u'M', u'Illinois',  
u'2.01']]
```

9.4. Create Key-Value-Pairs (KVP) with state being the key and the number "1" being the value.

```
>>> mapByStateCode = justMales.map(lambda line: (line[2], 1))  
>>> mapByStateCode.take(4)  
[(u'Maryland', 1), (u'Illinois', 1), (u'Illinois', 1), (u'New Jersey', 1)]
```

9.5. Count up the number of customers by state.

```
>>> nbrCustsByState = mapByStateCode.reduceByKey(lambda a,b: a+b)  
>>> nbrCustsByState.take(4)  
[(u'Wisconsin', 2), (u'New Jersey', 4), (u'Michigan', 8), (u'Pennsylvania',  
2)]
```

9.6. Flip the KVP so that the count is first and order that from highest to lowest.

```
>>> highToLowCountAndState = nbrCustsByState.map(lambda (a,b):  
(b,a)).sortByKey(ascending=False)  
>>> highToLowCountAndState.take(6)  
[(8, u'Michigan'), (8, u'Maryland'), (7, u'Illinois'), (5, u'Nebraska'), (4,  
u'New Jersey'), (4, u'Indiana')]
```

9.7. Flip the KVP pair back to state and count plus add an index to represent the ordering sequence.

```
>>> stateCountIndexedHighToLow = highToLowCountAndState.map(lambda (a,b):  
(b,a)).zipWithIndex()  
>>> stateCountIndexedHighToLow.take(6)  
[((u'Michigan', 8), 0), ((u'Maryland', 8), 1), ((u'Illinois', 7), 2),  
((u'Nebraska', 5), 3), ((u'New Jersey', 4), 4), ((u'Indiana', 4), 5)]
```

9.8. Eliminate all records except for the top 5.

```
>>> topFive = stateCountIndexedHighToLow.filter(lambda (a,b),c): c<5)
>>> topFive.collect()
[((u'Michigan', 8), 0), ((u'Maryland', 8), 1), ((u'Illinois', 7), 2),
((u'Nebraska', 5), 3), ((u'New Jersey', 4), 4)]
```

9.9. Eliminate the index and the counts to just return the top 5 state names.

```
>>> top5Names = topFive.map(lambda (a,b),c): a)
>>> top5Names.collect()
[u'Michigan', u'Maryland', u'Illinois', u'Nebraska', u'New Jersey']
```

9.10. As before, chain all the method invocations into a single operation as is more the normal usage pattern.

```
>>> sc.textFile("hdfs://sandbox:8020/user/root/spark/customer.csv") \
    .map(lambda line: line.split(',')) \
    .filter(lambda line: line[1] == 'M') \
    .map(lambda line: (line[2], 1)) \
    .reduceByKey(lambda a,b: a+b) \
    .map(lambda (a,b): (b,a)) \
    .sortByKey(ascending=False) \
    .map(lambda (a,b): (b,a)) \
    .zipWithIndex() \
    .filter(lambda ((a,b),c): c<5) \
    .map(lambda ((a,b),c): a) \
    .collect()
[u'Michigan', u'Maryland', u'Illinois', u'Nebraska', u'New Jersey']
```

Result: Successful use of Spark Core and RDD to read files and perform data analysis.

Lab: Exploring Spark SQL

This lab utilizes Spark SQL and DataFrames within the Python Spark Shell.

Lester Martin Jr. 11/9/2015 7:16 PM

Formatted: No bullets or numbering

Objective:	Create DataFrame structure from Hive tables & HDFS files and utilize both the DataFrame API and SQL to refine returned data.
File locations:	/root/devph/labs/Spark
Successful outcome:	You will have successfully queries data from multiple DataFrame objects as well as joined them together.
Before you begin:	Your HDP 2.3 cluster should be up and running within your VM.
Related lesson:	Spark SQL and DataFrames

Perform the following steps:

Step 10: Run a query on an existing Hive table.

10.1. Load file into HDFS and create a Hive table mapping to it.

```
[root@sandbox Spark]# hdfs dfs -mkdir spark/cust fav
[root@sandbox Spark]# hdfs dfs -put cust fav.csv spark/cust fav/
[root@sandbox Spark]# hive -f cust fav.hive
[root@sandbox Spark]# hive -e 'select * from cust fav limit 5;'
OK
Irvin Riesling
Owen Pinot Noir
August Sauvignon Blanc
Christian Merlot
Arlen Pinot Noir
Time taken: 3.023 seconds, Fetched: 5 row(s)
```

10.2. Create a DataFrame from querying the Hive table created in the prior step after starting up pyspark again.

```
>>> from pyspark.sql import HiveContext
>>> hc = HiveContext(sc)
>>> custFavDF = hc.sql("SELECT * FROM cust fav")
>>> custFavDF.show(5)
+-----+-----+
|cust name| wine type|
+-----+-----+
| Irvin| Riesling|
| Owen| Pinot Noir|
| August| Sauvignon Blanc|
| Christian| Merlot|
| Arlen| Pinot Noir|
```

Step 11: Using the same customer data file from the prior lab, find the average length of customers by gender and state.

11.1. Import the necessary Row definition and then create a RDD from the customer.csv file previously loaded into HDFS.

```
>>> from pyspark.sql import Row
>>> customerRaw =
sc.textFile("hdfs://sandbox:8020/user/root/spark/customer.csv")
>>> customerRaw.take(2)
[u' Irvin,M,Maryland,5.06', u'Owen,M,Illinois,2.01']
```

11.2. Break each long string representing a row from the input file into discrete customer records.

```
>>> customerRecords = customerRaw.map(lambda line: line.split(','))
>>> customerRecords.take(2)
[[u' Irvin', u'M', u'Maryland', u'5.06'], [u'Owen', u'M', u'Illinois',
u'2.01']]
```

11.3. Convert that the RDD to a DataFrame.

```
>>> customerDF = customerRecords.map(lambda c: Row(name=c[0], gender=c[1],
state=c[2], length=float(c[3]))).toDF()
>>> customerDF.show(2)
+-----+-----+-----+-----+
|gender|length| name| state|
+-----+-----+-----+-----+
| M| 5.06| Irvin| Maryland|
| M| 2.01| Owen| Illinois|
+-----+-----+-----+-----+
```

11.4. Search for the final results with the DataFrame API.

```
>>>
customerDF.select("gender", "state", "length").groupBy("gender", "state").avg("length").show()
+-----+-----+-----+-----+
|gender| state| AVG(length)|
+-----+-----+-----+-----+
| F| Illinois| 7.49|
| F| New Jersey| 4.04|
| F| Minnesota| 6.204|
| F| Michigan| 4.207142857142857|
| M| Indiana| 4.369999999999999|
| M| Maryland| 5.326250000000001|
| M| Nebraska| 6.516|
| M| Illinois| 4.858571428571428|
| M| New Jersey| 4.6499999999999995|
| M| Minnesota| 5.4375|
| F| Wisconsin| 6.29125|
| M| Michigan| 5.0337499999999995|
| F| Pennsylvania| 5.575|
```

```
| F| Ohio| 5.93|
| F| Iowa| 7.430000000000001|
| M| Wisconsin| 0.33|
| M| Pennsylvania| 3.665|
| M| Ohio| 4.25|
| M| Iowa| 5.753333333333333|
| F| Maryland| 5.003749999999999|
+-----+-----+-----+
```

Step 12: Join the prior two DataFrames.

12.1. Utilize the DataFrame API to perform the join.

```
>>> customerDF.join(custFavDF, customerDF.name ==
custFavDF.cust_name).show(5)
+-----+-----+-----+-----+-----+-----+
|gender|length| name| state|cust name| wine type|
+-----+-----+-----+-----+-----+-----+
| M| 5.06| Irvin| Maryland| Irvin| Riesling|
| M| 2.01| Owen| Illinois| Owen| Pinot Noir|
| M| 1.42| August| Illinois| August| Sauvignon Blanc|
| M| 8.17| Christian| New Jersey| Christian| Merlot|
| M| 2.24| Arlen| Indiana| Arlen| Pinot Noir|
+-----+-----+-----+-----+-----+-----+
```

Result: Successful creation of a DataFrame from a Hive tables and a HDFS file; as well as joining these two DataFrames.

Appendix: Quick troubleshooting steps

If VM was not shut down properly for multiple occasions or some of the daemons aren't working properly, please try the following:

1. Execute the following command:
`service startup_script restart`
2. If service startup_script restart does not work, execute the following:
Run the "jps" command and identify PID for all running processes.
Kill these processes using the "kill -9 <PID>" command
Remove all *.pid files from the corresponding /var/run/<SERVICE> directories
Run "service startup_script restart"
3. If services still don't come back up, try stop all, start all from Ambari. If Ambari no longer works, try service ambari stop and service ambari start.

In most cases, rebooting VM will fix the problem.
